### ACKNOWLEDGEMENTS

Roger Williams, Chief of the Game Division, and other personnel of the Idaho Fish and Game Department assisted in the formulation of the questionnaires. Conservation officers throughout the state contacted residents in a special follow-up of non-respondents.

Claude Clapsaddle provided the mailing lists and address labels. Sherry Anderson mailed the questionnaires and with Winona Richey transferred the data to key-punch forms from the questionnaires. Don Rose and Karen Falke of the University of Idaho Computer Center prepared the programs to process the data. Anne Frounfelker, Elaine and Eileen Bjornn tabulated much of the computer output and prepared the figures.

Verabel Abbott and Merry Mast typed the manuscript.

## LIST OF TABLES

Table	Page	
1	The number of Idaho hunting licenses sold in 1971, people in initial sample, people in sample with undeliverable addresses, net number of people in sample (adjusted for undeliverables), percentage of people with licenses who were included in sample, number of questionnaires returned with usable information, percentage of people in sample who returned questionnaires and the returned questionnaires as a percentage of the licenses sold.	6
2	The number of questionnaires mailed, number returned and percentage returned for each residence zone of survey.	6
3	The number of people we sent questionnaires to by month, license class and zone of residence.	8
4	The number of questionnaires mailed initially and with each followup and the number and percentages returned. The third followup consisted of a personal contact by a conservation officer of the Idaho residents who had not responded to the questionnaire sent out for the October sampling period.	10
5	The number of questionnaires mailed and the number and percentage returned by residents in the October sampling period.	10
6	The number of people who ranked each management activity with a 1, 2 or 3 and a weighted score for each activity obtained by multiplying the number of 1 rankings by 3, 2 rankings by 2, and 3 rankings by 1 and then summing the products.	13
7	Residence of persons who purchased licenses to hunt in Idaho in 1971.	13
8	The number of males of various ages living in Idaho during the 1970 census, males who purchased hunting licenses in 1971 and the estimated percentage of resident males in Idaho who purchased hunting licenses.	13
9	The percentage of the estimated total days hunted for elk, deer, pheasants, ducks and forest grouse in Idaho during 1971 by residents versus non-residents.	15
10	The percentage of the estimated total days hunted by residents and non-residents spent on the major game species.	15
11	The percentage of the days hunted by residents and non-residents for elk (primarily but deer also), deer, pheasants, forest grouse and ducks in each zone of the state in 1971 and the distribution of the statewide hunter population.	16
12	The percentage of people who hunted big game, upland birds or waterfowl in Idaho 1, 2-5, 6-10, or 11 or more years.	16
13	The percentage of resident hunters who ranked the following sources of information on hunting and fish and wildlife management in Idaho as their most important sources by age group and years of hunting.	18
14	The percentage of people in the sample who listed meat, trophy, etc., as their most important reasons for hunting in Idaho.	20
15	The percentage of licensed resident hunters by age, type hunting preferred, and satisfaction with hunting who listed meat, trophy, etc., as their most important reasons for hunting in Idaho in 1971.	20
16	The preferred type hunting by residents and non-residents who purchased Idaho hunting licenses during 1971.	21
17	The preferred type of hunting of people who hunted in Idaho in 1971 by occupation.	21

18	The preferred species of waterfowl of resident and non-resident hunters.	22
19	The type of big game animal the people preferred to kill.	24
20	The type elk or deer preferred by residents grouped by years of hunting, satisfaction with hunting, zone of residence, and reason for hunting.	25
21	The degree of satisfaction of people who purchased licenses to hunt big game, upland birds and waterfowl in Idaho in 1971.	26
22	The satisfaction with hunting in Idaho by residents who did or did not hunt or bag the game they sought.	26
23	The degree of satisfaction with hunting in Idaho of resident hunters based on years of hunting.	27
24	The most important reasons people were dissatisfied with hunting big game, upland birds or waterfowl in Idaho in 1971.	27
25	The percentage of resident hunters who did or did not have confidence in the game counts and harvest figures released by the Idaho Fish and Game Department grouped by age, preferred type of hunting and satisfaction with hunting.	30
26	The percentage of residents and non-residents who thought the Fish and Game Department was or was not doing a satisfactory job of managing wildlife in Idaho. People with no opinion not given in table but comprise difference between sum of yes and no replies and 100%.	31
27	The percentage of residents in each zone who thought Fish and Game Department personnel were doing a satisfactory job of managing wildlife in Idaho.	32
28	The percentage of resident hunters who thought the Idaho Fish and Game Department was or was not doing a satisfactory job of managing various game species grouped by years of hunting.	33
29	The percentage of resident hunters who thought the Idaho Fish and Game Department was or was not doing a satisfactory job of managing various game species by their reported satisfaction with hunting.	34
30	The number of residents and non-residents who purchased licenses to hunt in Idaho, percentage of deer and elk hunters who were non-residents and the percentage of deer and elk harvested by non-residents.	35
31	The percentage of people in our sample who preferred to (1) allow unrestricted numbers, (2) restrict the number, or (3) had no opinion on the restriction of numbers of out-of-state hunters in Idaho.	35
32	The attitude of residents regarding the restriction of out-of-state hunters in Idaho, when grouped by type hunting preferred, reason for hunting, occupation, income, competition experience with non-residents, reason for dissatisfaction, hunting success and satisfaction with hunting.	36
33	The type restriction of non-resident hunters preferred by residents and non-residents who thought Idaho should restrict the number of out-of-state hunters.	36
34	The percentage of resident hunters grouped by the type hunting they preferred and their satisfaction with hunting, who thought non-resident hunters should be limited to areas where residents do not adequately harvest game or to a percentage of all hunters.	37
35	The percentage of people with various views on the Idaho Fish and Game Commission policy on limitation of out-of-state big game hunters.	37
36	The views of residents grouped by the competition they experienced with out-of-state big game hunters in Idaho during 1971 regarding the Fish and Game Commission policy on restriction of out-of-state hunters.	38

- 37 The percentage of people grouped by years they hunted, type hunting they preferred, and their satisfaction with hunting who thought competition with out-of-state hunters was not noticeable, noticeable but not objectionable, too much, or had no opinion when hunting in Idaho during 1971. 39
- 38 The percentage of non-resident hunters who believed that residents should have preference in hunting for wildlife in Idaho, that the number of non-resident hunters should be limited, that non-residents should have equal opportunity with residents and those that had no opinion. 40
- 39 The percentage of residents who purchased licenses in 1971 who were willing to pay more for licenses and tags to hunt in Idaho if the number of non-residents were significantly restricted. 41
- 40 The percentage of non-residents who were willing to pay more for licenses to hunt big game, upland birds and waterfowl in Idaho in 1971. 42
- 41 The percentage of resident hunters grouped by their experience of competition with out-of-state big game hunters in Idaho during 1971 and their hunting preference who would or would not pay an increased annual fee for hunting licenses or elk or deer tags if the number of out-of-state hunters were restricted. 42
- 42 The percentage of residents grouped by years they had hunted upland birds who preferred the noon or early morning opening for pheasants in southern Idaho. 43
- 43 The percentage of residents (with combination license) of various occupation classes and residence zones who preferred the noon opening in southern Idaho. 43
- 44 The percentage of resident hunters who thought hen pheasants should or should not be hunted in Idaho grouped by years of hunting, type hunting preferred, satisfaction with upland bird hunting and reason for hunting. 44
- 45 The percentage of resident hunters who thought hunting provided by game farm pheasants was or was not a good program that should or should not be continued, grouped by years of hunting upland birds, type hunting preferred, satisfaction with upland bird hunting and reason for hunting. 44
- 46 The percentage of licensed hunters who thought the Department should or should not attempt to artificially increase the abundance of deer and elk through supplemental winter feeding. 45
- 47 The percentage of resident hunters who thought the Idaho Fish and Game Department should or should not attempt to increase big game herds by supplemental winter feeding, grouped by years they hunted big game, satisfaction with their big game hunting, their main reason for hunting, and their occupation. 46
- 48 The percentage of residents and non-residents who believe the amount and condition of vegetation on big game winter range was or was not the proper basis for managing big game populations. 46
- 49 The percentage of resident hunters who thought the amount and condition of vegetation on big game winter range was or was not the proper basis for managing big game populations grouped by years of hunting and occupation. 47
- 50 The percentage of licensed hunters who believed there should be supplemental salting of big game, those who believed supplemental salting unnecessary, and those having no opinion. 47
- 51 The percentage of resident hunters who thought supplemental salt was or was not necessary for big game animals grouped by the number of years they had hunted and their occupation. 47
- 52 The percentage of residents and non-residents who preferred to manage big game herds for quantity, quality, or both types of hunting. 48

- 53 The percentage of resident hunters who preferred quantity; quality, or both types of big game hunting grouped by their age, years of hunting, preferred type of hunting, satisfaction with big game hunting and reason for hunting. 48
- 54 The percentage of resident hunters who preferred to shorten the season or have controlled hunts to restrict the harvest of deer when necessary with grouping by age, years of hunting, satisfaction with big game hunting and reason for hunting. 49
- 55 The percentage of resident hunters who preferred to increase the length of the season or allow extra tags to increase the harvest of deer when necessary with response by years of hunting, satisfaction with big game hunting and reason for hunting. 50
- 56 The percentage of resident hunters who believed there should be more roads, no more roads were needed, there were too many roads or had no opinion on the question of roads as related to big game hunting by age group, occupation, years of hunting, hunting preference, satisfaction with hunting, and reason for hunting. 51
- 57 The percentage of resident hunters who preferred to hunt bear in the fall and/or spring or all year according to the number of years they hunted big game. 52
- 58 The percentage of resident hunters who thought bear should or should not be hunted with hounds, and if they should, when they should be hunted, grouped by years of hunting big game. 53
- 59 The percentage of residents and non-residents who listed the activities below as the most important activities for the Fish and Game Department. 53
- 60 The percentage of resident hunters who ranked each of the activities listed below as the most important activity for the Fish and Game Department by years of hunting, hunting preference, and age. 54
- 61 The percentage of residents and non-residents who believed the Fish and Game Department should place more, less, or no change in the emphasis on various activities. 55
- 62 The percentage of resident hunters who believed the Fish and Game Department should place more, less, or no change in the emphasis on predator control grouped by age, years hunted, and occupation classes. 55

## LIST OF FIGURES

Figure		Page
1	Questionnaire sent to people who purchased licenses to hunt in Idaho during 1971.	4
	Figure 1 Continued.	5
2	Residence zones used in survey of people who hunted in Idaho in 1971.	7
3	Map of Idaho included with the questionnaires to identify the six hunting areas used in the survey.	8
4	The number of questionnaires returned by date from the first, second and third mailings and conservation officer followup for the October sampling of residents.	9
5	The percentage of people who preferred big game hunting, etc., for the first, second, third or fourth response and the percentage for the cumulative response expressed as a percentage of the total sample.	11
6	Examples of the opinions and preferences of residents according to the month of sampling.	12
7	Age distribution of Idaho males (1970 census), residents and non-residents in 1971 survey.	14
8	Percentage of Idaho male (1970 census), residents and non-residents in various occupational groupings in the survey.	14
9	Percentage of Idaho families (1970 census) and resident and non-resident families in 1971 survey with annual incomes as listed.	15
10	The percentage of residents and non-residents in survey who had hunted 1, 2-5, 6-10, or 11 or more years for big game, upland birds or waterfowl in Idaho.	16
11	The percentage of resident and non-resident hunters who ranked magazines, newspapers, etc., as their most important source of information about hunting regulations and wildlife management programs.	17
12	The percentage of hunters in sample who received "Idaho Wildlife Review," had read it, and who had not seen the magazine.	18
13	The percentage of residents and non-residents who listed meat, trophy, etc., as their primary reason for hunting.	19
14	The percentage of residents by residence zone and non-residents by type of license who ranked big game, upland bird or waterfowl as the type hunting they most preferred.	21
15	The preferred species of big game of residents statewide and within each residence zone and of non-residents who purchased the combination and deer licenses in 1971.	22
16	The preferred species of upland birds of residents on a statewide basis and each zone of residence and of non-residents with the combination and bird licenses in 1971.	22
17	The percentage of residents and non-residents who preferred various types of animals when hunting deer, elk, and antelope.	23
18	The degree of satisfaction of residents and non-residents with their hunting in Idaho.	26
19	The percentage of people who did, did not have confidence, or were skeptical of Idaho Fish and Game Department game counts. Those with no opinion excluded from figure but comprise remainder of 100%.	28

- 20 The percentage of people who did, did not, or were skeptical of Idaho Fish and Game Department kill information. Those with no opinion excluded from figure but comprise remainder of 100%. 29
- 21 The percentage of residents who thought competition with non-residents while hunting big game, upland birds or waterfowl in Idaho in 1971 was not noticeable, noticeable but not objectionable, too much, or had no opinion. 38
- 22 The percentage of residents by zone of residence who thought competition with out-of-state hunters while hunting big game in 1971 was not noticeable, noticeable but not objectionable, too much, or had no opinion. 38
- 23 The percentage of residents who thought the proportion of out-of-state deer and elk hunters in Idaho was too high, about right, too low, or had no opinion. 41
- 24 The percentage of residents by zone who were willing to pay more for licenses or tags if the number of out-of-state hunters were restricted. 41
- 25 The percentage of residents and non-resident bird hunters who preferred a noon or early morning opening for the pheasant season in southern Idaho. 42
- 26 The percentage of residents (statewide and from various zones) and non-residents who thought hen pheasants should not be hunted, thought limited numbers of hens should be harvested, thought hens should be hunted without restrictions, or had no opinion. 43
- 27 The proportion of residents and non-resident bird hunters who thought providing hunting with game farm produced pheasants should be continued or discontinued. 44
- 28 The percentage of residents and non-residents who approved, disapproved, had no opinion, or did not know the Fish and Game Department's policy on regulating big game numbers. 45
- 29 The percentage of residents and non-residents who approved, disapproved, had no opinion, or did not know the Fish and Game Department's policy on winter emergency feeding of big game. 46
- 30 The percentage of residents and non-residents who preferred to restrict the harvest of big game by shorter general seasons or controlled hunts. 48
- 31 The percentage of residents and non-residents who preferred to increase the deer harvest by increasing the length of the season or providing extra tags. 49
- 32 The percentage of residents and non-residents who thought more roads were needed, no more were needed, or there were already too many roads with regard to big game hunting in Idaho. 50
- 33 The percentage of people who preferred to hunt bear in the fall, spring, fall and spring, all year, or had no opinion. 51
- 34 The percentage of people who thought bears should or should not be hunted with hounds in Idaho. 52
- 35 The percentage of residents and non-residents who thought predator control (PC), habitat improvement (HI), law enforcement (LE), or emergency winter feeding (EWF) were the most important activities of the Idaho Fish and Game Department. 53

## ABSTRACT

We conducted a questionnaire survey to describe the people who hunted in Idaho, their hunting activities and their preferences and opinions on management issues. We mailed questionnaires to 7,602 people with resident licenses and 2,638 with non-resident licenses to hunt in Idaho during 1971. Sixty-one percent of the residents and 71% of the non-residents completed and returned their questionnaires.

In 1971, 215,000 people purchased licenses to hunt in Idaho. Residents comprized 91% of the licensed hunters and nearly half the non-residents came from California. Most (76-92%) of the resident males in the 20-50 age groups purchased hunting licenses in 1971. More than half the resident hunters had incomes of \$7-15,000, but income was not an important factor in the decision of residents to purchase a hunting license. Non-residents who hunted in Idaho had larger incomes on average than residents.

Residents accounted for 92-97% of the days hunted for the major game species in 1971. Hunting for elk (and deer incidentally) amounted to 24% of the days reported by residents and 39% of non-residents. Hunting for deer, pheasants and ducks by residents amounted to 15, 17 and 17% respectively, of the days they hunted. The distribution of hunting within Idaho was related to the species sought and area of residence.

More than half (54-63% depending on type hunting) the residents who responded had hunted in Idaho six or more years and 46% of the non-residents were hunting in Idaho for the first time. Forty-three percent of the residents reported they hunted primarily for meat with only 2% after a trophy. Non-residents hunted mainly for relaxation, challenge of the hunt, trophy and opportunity to get out-of-doors.

Most residents (73%) preferred big game hunting over upland bird (19%) or waterfowl (9%) hunting. Nearly all (97%) of the non-residents with the combination or deer only licenses preferred big game hunting while 75% of those with the bird license preferred upland bird hunting. Fifty-seven percent of the residents preferred to hunt deer when big game hunting while 80% of the non-residents with the combination license preferred elk. Pheasants and ducks were the most preferred species of upland

birds and waterfowl. Many residents had no preference in the type deer or elk they bagged while more than half the non-residents preferred a large buck or bull, an attitude consistent with their reason for hunting (to bag a trophy).

A majority of residents ranked their hunting in Idaho as satisfactory or excellent, but one-third of the hunters ranked their big game hunting as unsatisfactory. Satisfaction with hunting was related to success in bagging an animal or birds. Residents listed lack of game, too many hunters, and not bagging game as the primary reasons for their dissatisfaction with hunting.

Nearly half the residents and one-fourth the non-residents expressed a lack of confidence in the game count and game kill information provided by the Idaho Fish and Game Department. A majority of the residents, with an opinion, thought Department personnel satisfactorily managed Idaho wildlife, but 42% wanted better management for deer, 38% for elk, and 20% for pheasants.

Most residents (86%) preferred to restrict the number of out-of-state hunters in Idaho. A majority of residents who knew the Idaho Fish and Game Commission policy on out-of-state hunters thought the Commission should have restricted the number of non-residents further. Forty percent of the residents thought competition with out-of-state hunters while hunting big game in 1971 was not noticeable or not objectionable while 33% believed there was too much competition. More than half the non-residents thought they should have equal opportunity with residents to hunt wildlife in states such as Idaho with large areas of federal land. Nearly three-fourths of the residents indicated they would pay more for hunting licenses and tags to make up for lost revenue if Idaho significantly restricted the number of out-of-state hunters.

In southern Idaho, most residents preferred the noon opening for pheasants rather than the early morning time, regardless of occupation. A majority of residents thought a limited number of hen pheasants should be harvested under special regulations. Opinion on providing hunting with game farm pheasants was evenly split, half of those with an opinion thought it was a good program and half thought it was a

poor program and should be discontinued.

A majority of the residents who thought they knew the policy and had an opinion approved of the current policy of the Fish and Game Department with regard to regulating big game numbers (" . . . number which natural range will support . . . ") and emergency winter feeding (" . . . only as a last resort."). Half the residents, however, thought the Department should attempt to increase big game herds through supplemental winter feeding. A majority of the residents thought the amount and condition of vegetation on the winter range was the proper basis for managing big game populations and that it was necessary to distribute supplemental salt for big game animals.

Ten percent of the residents wanted big game herds managed for "quantity" hunting, 21% wanted "quality" hunting, and 41% wanted both types of hunting available. Residents were

evenly split on shorter seasons or controlled hunts to restrict the harvest of big game animals. To increase the deer harvest, half the residents preferred to increase season length and half wanted extra tags, but there were differences between zones of the state.

Most residents (75%) and non-residents (73%) thought no more roads were needed for big game hunting in Idaho. Forty-eight percent of the residents thought there were already too many roads, no new ones should be constructed and some of the existing roads should be closed.

Law enforcement, habitat improvement, and emergency winter feeding were the activities of the Department that the largest proportion of residents thought were most important. Predator control, game farms, and access to hunting areas were the three activities a significant number of people thought should receive less emphasis from the Department.

## INTRODUCTION

In recent years, the public has become more interested in the policies and programs of public resource agencies. Administrators of these agencies found they needed better input from the public when choosing between the available management alternatives. Resource managers can no longer choose unilaterally and autocratically, however well intentioned, between alternative uses of publicly owned resources.

With this survey we sought information from members of the public who use Idaho wildlife resources for hunting. Fish and game managers needed a better description of the people who hunt in Idaho, their hunting activities and their opinions and preferences on important issues related to hunting and management of wildlife in Idaho.

Traditionally, fish and game managers in Idaho obtained their public input from personal contacts with local sportsmen and periodic attendance at the local, regional or statewide wildlife association meetings. However, only a small proportion of the people who hunted in Idaho during the early 1970's participated in organized clubs. The Idaho Fish and Game Commission held public hearings in conjunction with their periodic meetings to obtain public input but relatively few people took advantage of the opportunity to attend what often developed into "gripe sessions."

Traditional methods of obtaining public opinions and preferences on wildlife matters restricted the input to a relatively small group of "especially interested" people. In 1971, Idaho Fish and Game Department administrators decided to seek information from a larger, more diversified group of the hunting public regarding selected topics of special concern. They requested us (personnel of the Idaho Cooperative Fishery Unit) to conduct a questionnaire survey of Idaho hunters because of our experience with such surveys.

We recognize that the answers to many of our questions might be termed "gut reactions" because we did nothing more than ask the people to choose between alternatives. The people had to rely on their experiences and knowledge of the situation to answer the questions. In most cases we suspect the people were not as fully aware of the trade-offs associated with each alternative and did not have the type of information available to

the wildlife manager. Some people changed their minds on some issues when presented with the trade-offs and additional information (See Bjornn, 1975 A).

## SURVEY METHODS

We selected a sample of people who purchased Idaho hunting licenses in 1971, mailed them a questionnaire (and follow-ups if necessary) and then summarized their answers with the aid of a computer.

### Questionnaire Preparation and Content

Initially, wildlife managers in Idaho submitted to us their ideas of the questions to ask the public and the problems on which they needed public input. We then formulated a number of questions and met with the headquarters staff of the Idaho Fish and Game Department to select the topics to include in the survey and the precise wording of each question.

The questionnaire (Figure 1) contained questions to obtain four types of information: 1) demographic data on the people in the sample, 2) data on their behavior and activities while hunting, 3) their opinions and preferences on selected problems and possible management alternatives and 4) data on the economic expenditures of people related to hunting in Idaho.

### Sample Size

Our initial sample consisted of 10,240 people selected from the stubs of the five resident and non-resident license classes (Table 1). Nearly four percent of the names and addresses obtained from the stubs were not adequate for delivery by the U. S. Post Office so our net sample size was 9,841 people or 4.6% of the licenses sold in 1971.

The number of people we included in the sample from each license class was based on the expected rate of return for each class (information from previous surveys), number of license holders in each class and number in each residence zone.

We drew our sample from the resident license stubs systematically so the number of

Dear Hunter:

This questionnaire is designed to assess your preferences and attitudes on a number of key issues and problems in Idaho wildlife management, your expenditures while hunting in Idaho, and to provide background information to help us describe people who hunt in Idaho. This is an opportunity for you to participate in decisions regarding the future management of wildlife in Idaho. Please take the time to provide us with the information requested.

Thank you.

1. How many years have you hunted each category of game in Idaho, and which type of hunting do you most prefer (Rank from 1 to 3)? Then list the one species in each category that you most prefer to hunt.

	Years Hunted		Preferred Species
	Hunted	Rank	
Big Game	_____	_____	_____
Upland Birds	_____	_____	_____
Waterfowl	_____	_____	_____

2. Rank (1 to 3) the three most important sources of your information about hunting and fishing regulations and wildlife management programs in Idaho:

- \_\_\_\_\_ Hunting and fishing magazines
- \_\_\_\_\_ Newspapers
- \_\_\_\_\_ Television
- \_\_\_\_\_ Radio
- \_\_\_\_\_ License vendors
- \_\_\_\_\_ Fish and Game Department regulations
- \_\_\_\_\_ Idaho Wildlife Review
- \_\_\_\_\_ Friends-hunting companions
- \_\_\_\_\_ Sportsmen club meetings
- \_\_\_\_\_ Other (List) \_\_\_\_\_

3. Please estimate the number of miles your personal vehicle was driven in Idaho during SEPTEMBER, 1971, when you hunted:

	Miles driven
Big Game	_____
Upland Birds	_____
Waterfowl	_____

4. For each species of wildlife you hunted in Idaho during SEPTEMBER, 1971, please list the number of days you hunted in each area (See Map).

Species Hunted	Days Spent Hunting in Each Area:			
	Area		Days	
Only Elk	_____	_____	_____	_____
Only Deer	_____	_____	_____	_____
Deer & Elk	_____	_____	_____	_____
Antelope	_____	_____	_____	_____
Ducks	_____	_____	_____	_____
Geese	_____	_____	_____	_____
Chukars	_____	_____	_____	_____
Quail	_____	_____	_____	_____
Pheasant	_____	_____	_____	_____
Forest Grouse	_____	_____	_____	_____
Other	_____	_____	_____	_____
(List)	_____	_____	_____	_____

5. Please indicate if you hunted in Idaho during SEPTEMBER, 1971. If you bagged some game, list the species and number taken.

	Hunted in September?		Species and number bagged
	Yes	No

(describe)

10. Which of the following best expresses your feeling regarding out-of-state hunters and hunting of wildlife in Idaho? (Check ONE)

- Allow unrestricted numbers of out-of-state hunters in Idaho.
- Restrict the number of out-of-state hunters in Idaho.
- No Opinion.

If you believe out-of-state hunters should be restricted, which of the following do you prefer? (Check One)

- Out-of-state hunters should be allowed to hunt only in those areas where residents do not adequately harvest the game.
- Restrict the number of out-of-state hunters to 20% , 10% , or 5%  of all hunters.
- No out-of-state hunters should be allowed to hunt in Idaho.

11. If you hunted in Idaho during 1971, which of the categories below best describes your experiences with regard to competition with the out-of-state hunters? (Check ONE for each game category)

	Big Game	Upland Birds	Waterfowl
Not noticeable	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Noticeable, but not objectionable	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Too much competition from non-residents	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
No Opinion	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

12. Which of the following best expresses your feeling regarding the Fish and Game Commission's limitation on the number of out-of-state big game hunters in 1971? (Check ONE)

- Should have allowed more out-of-state hunters.
- Should have reduced the number of out-of-state hunters further.
- Allowed about the right number.
- Do not know about restrictions.
- No Opinion.

13. If the number of out-of-state hunters were significantly restricted, would you be willing to pay increased annual fees to help make up for the lost revenue from license and tag sales?

	If yes, how much?			
	No	\$1	\$3	\$5 More
Hunting Licenses	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Elk Tag	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Deer Tag	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

14. Which of the following best describes your views regarding the distributing of supplemental salt for big game in certain areas? (Check ONE)

- Necessary and should be continued or expanded.
- Unnecessary and should be curtailed or stopped.
- No Opinion.

people in our sample from each residence zone (Figure 2 and Table 2) in Idaho was in approximate proportion to the number of licenses purchased by residents in each zone. The small number (149) of people in our sample from the Salmon River drainage zone reflected the small population in that zone. We accepted the smaller sample size from that zone because of the problems of finding stubs for residents of that zone and then properly weighting their responses.

We drew samples from the non-resident license stubs randomly without regard to residence zone for the bird hunting license and by residence zone for the combination and deer hunting licenses. We wanted 100 and 50 respectively, completed questionnaires from non-residents in each residence zone who purchased the combination and deer hunting licenses. We sent questionnaires to approximately 150 persons selected at random from each non-resident zone who had purchased the combination license and to 75 persons with deer licenses. The larger number of non-residents in our sample from the California and Wyoming-Nevada zones (Table 2) resulted from the larger number of persons in those zones who purchased bird hunting licenses.

The sample of 6,271 completed, usable questionnaires comprized 2.9% of all licensed hunters in 1971 (Table 1). We obtained

information from 2.3% of the residents and 9.4% of the non-residents. Although we included only 2.3% of the residents in the survey, the 4,430 questionnaires from residents were more than adequate from a statistical viewpoint. If we had chosen to select the sample in a random rather than systematic fashion we could have reduced the sample size for residents. The cost and difficulty of preparing the license stubs to permit random sampling were the main reasons we sampled in a systematic fashion and used the larger sample size.

### Mailing List Preparation and Mailing

Rather than send out all the questionnaires after the 1971 hunting season was completed, we mailed questionnaires after each of the four months of the season; September, October, November and December. Within 10 days after the end of each month we prepared a mailing list and mailed questionnaires, usually within 15 days, to a sample of people who had purchased licenses prior to the end of the previous month. For example, during the first 10 days of October we prepared a mailing list from the license stubs returned to the Fish and Game Department through October 5-8. We sampled on a monthly basis to improve the accuracy of the expenditure data and to assess changes in attitudes as the season progressed.

The mailing lists for residents and non-residents in each month's sample were prepared in two ways. The residents were selected systematically from the file of license stubs available at the end of each month.

License stubs were bound together in packets of 10 and we selected one stub from each packet included in the sample. For each month we calculated the number of packets required in the sample and randomly selected which license stub to pull from each packet. We selected a different license in each packet for each month to avoid sampling the same person more than once.

Once the stubs were selected, the name and address on the stub was entered on key punch cards along with a serial number. The serial number consisted of three parts: the license class (01, 02, 10, 11 or 17), the zone of residence (1 to 14) and an identification number. The key punch cards were sorted by license class and zone of residence and three sets of mailing labels were printed from the data on the cards.

The non-resident mailing list was selected randomly from the license stubs of the three non-resident license classes. The name and address on each non-resident hunting license

stub was entered on key punch cards along with a serial number. A random number deck was prepared each month (without replacement) and then matched with the key punch cards to select the persons in the sample. The selection of persons was stratified by residence zone for the combination and deer hunting licenses.

We sent approximately one-sixth of the questionnaires out after the months of September and December and one-third after the months of October and November because most of the hunting activity occurred during October and November (Table 3). We had adequate numbers of people in the sample from each month, license class and residence zone with the possible exception of the Salmon River

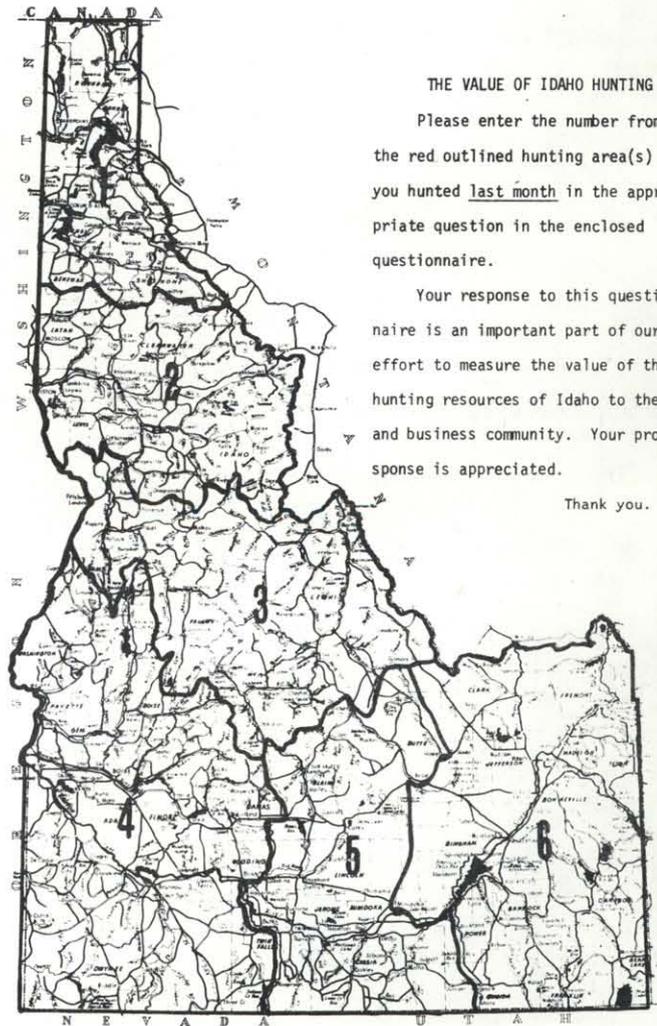

drainage zone for the months of September and December.

Once the mailing labels were prepared, the serial number was written on the bottom of an appropriate questionnaire (resident or non-resident) and it was placed in an envelope with a letter explaining the survey, a map (Figure 3) of the six areas in Idaho that related to questions in the questionnaire and a self-addressed envelope. One of the three labels was then placed on the envelope and the questionnaire was ready for mailing.

We usually mailed the questionnaires for each month between the 10th and 20th of the following month. Most people who returned the

**THE VALUE OF IDAHO HUNTING**  
Please enter the number from the red outlined hunting area(s) where you hunted last month in the appropriate question in the enclosed questionnaire.

Your response to this questionnaire is an important part of our effort to measure the value of the hunting resources of Idaho to the sports and business community. Your prompt response is appreciated.

Thank you.

Figure 3. — Map of Idaho included with the questionnaires to identify the six hunting areas used in the survey.

questionnaire did so within 20-30 days (Figure 4). As the questionnaires came back, we noted the serial number and destroyed the remaining two labels for that number. After three weeks, we prepared a second questionnaire with letter, map and return envelope for each label remaining in the second set of labels and mailed them to the non-respondents. We repeated this procedure a second time after an additional three weeks. We, therefore, sent questionnaires to people in the sample up to three times if they did not respond to the initial or second mailing.

We contacted resident non-respondents in our October sample a fourth time by asking Fish and Game Department Conservation Officers to deliver a fourth copy of the questionnaire. The Conservation Officers were instructed to contact the non-respondents, give

them the questionnaire, urge them to fill it out and then leave. The officers were not to wait for the questionnaire.

### Questionnaires Returned

The 6,271 questionnaires returned by people from all license classes amounted to a 63.7% return of the 9,841 actually mailed (excluding undeliverables, Table 1). The rate of return varied directly with the cost of the license (Table 4). Seventy-five percent of the people who purchased the \$135.00 non-resident, combination license returned their questionnaires after two follow-up contacts compared to only 48% for the residents who purchased the \$3.00 hunting license.

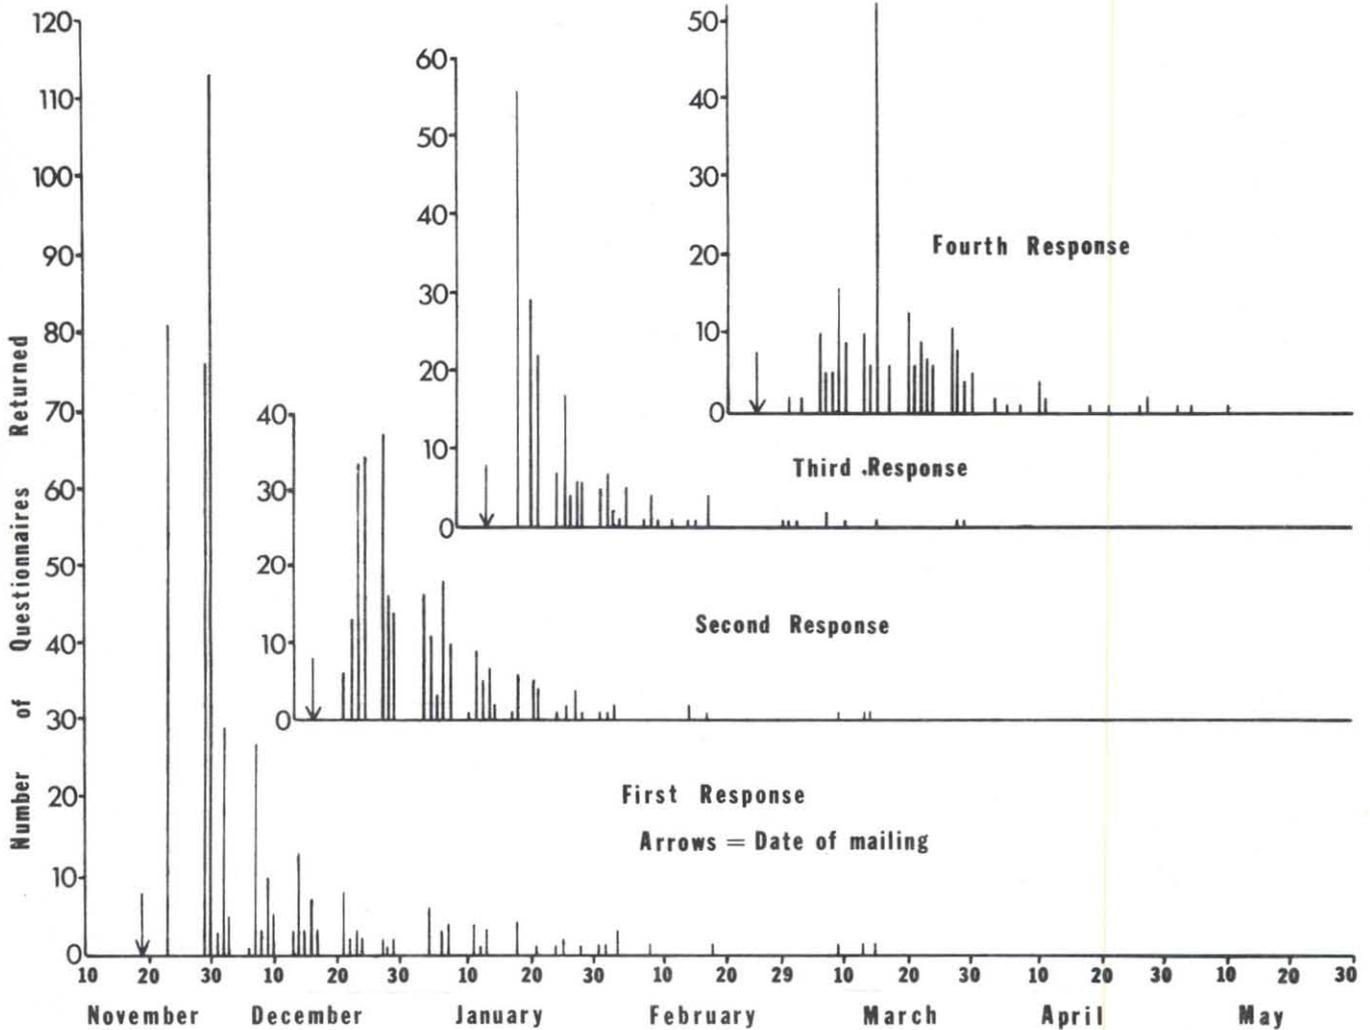

Figure 4. — The number of questionnaires returned by date from the first, second and third mailings and conservation officer followup for the October sampling of residents.

Table 4. — The number of questionnaires mailed initially and with each followup and the number and percentages returned. The third followup consisted of a personal contact by a conservation officer of the Idaho residents who had not responded to the questionnaire sent out for the October sampling period.

	License classes				
	Resident		Non-resident		
	Combination	Hunt only	Combination	Birds	Deer
Cost of license	\$6.00	\$3.00	\$135.00	\$35.00	\$75.00
<b>Initial mailing</b>

## Processing the Data

After the questionnaires had been returned, we transferred the data to key punch forms and then to punch cards for processing by computer. Programmers from the University Computer Center prepared programs to sort, weight and summarize the data.

Because our sampling and the response rates of people in each license class and/or residence zone were not uniform we had to weight the data whenever we combined data from different classes or zones. The weighting factors were the proportion of total licenses sold in each class or zone. Data from the non-resident combination and deer hunting license holders were weighted two or more times; once to combine data from zones and then from classes.

The data summaries we received from the computer center contained the responses to most questions by license class, zone of residence and by answers to other questions. The responses to some questions did not differ by license class or zone of residence and we did not include in this report the full data output in those cases.

## Non-response Bias

Since 37% of the people in our sample did not return a completed questionnaire, we had to determine if significant differences in attitudes and preferences existed between people who did or did not fill out and return a questionnaire. We evaluated the likelihood of differences in attitudes and preferences by comparing the responses of people who replied to the initial mailing and each follow-up. We also extrapolated a line through the plotted points of response — percentage of total sample to obtain an estimate of the response if 100% of the people in the sample had returned their questionnaires (Figure 5). We used the data from the October sampling period because we had three follow-ups in addition to the initial mailing and we obtained completed questionnaires from a large percentage of the people in the sample.

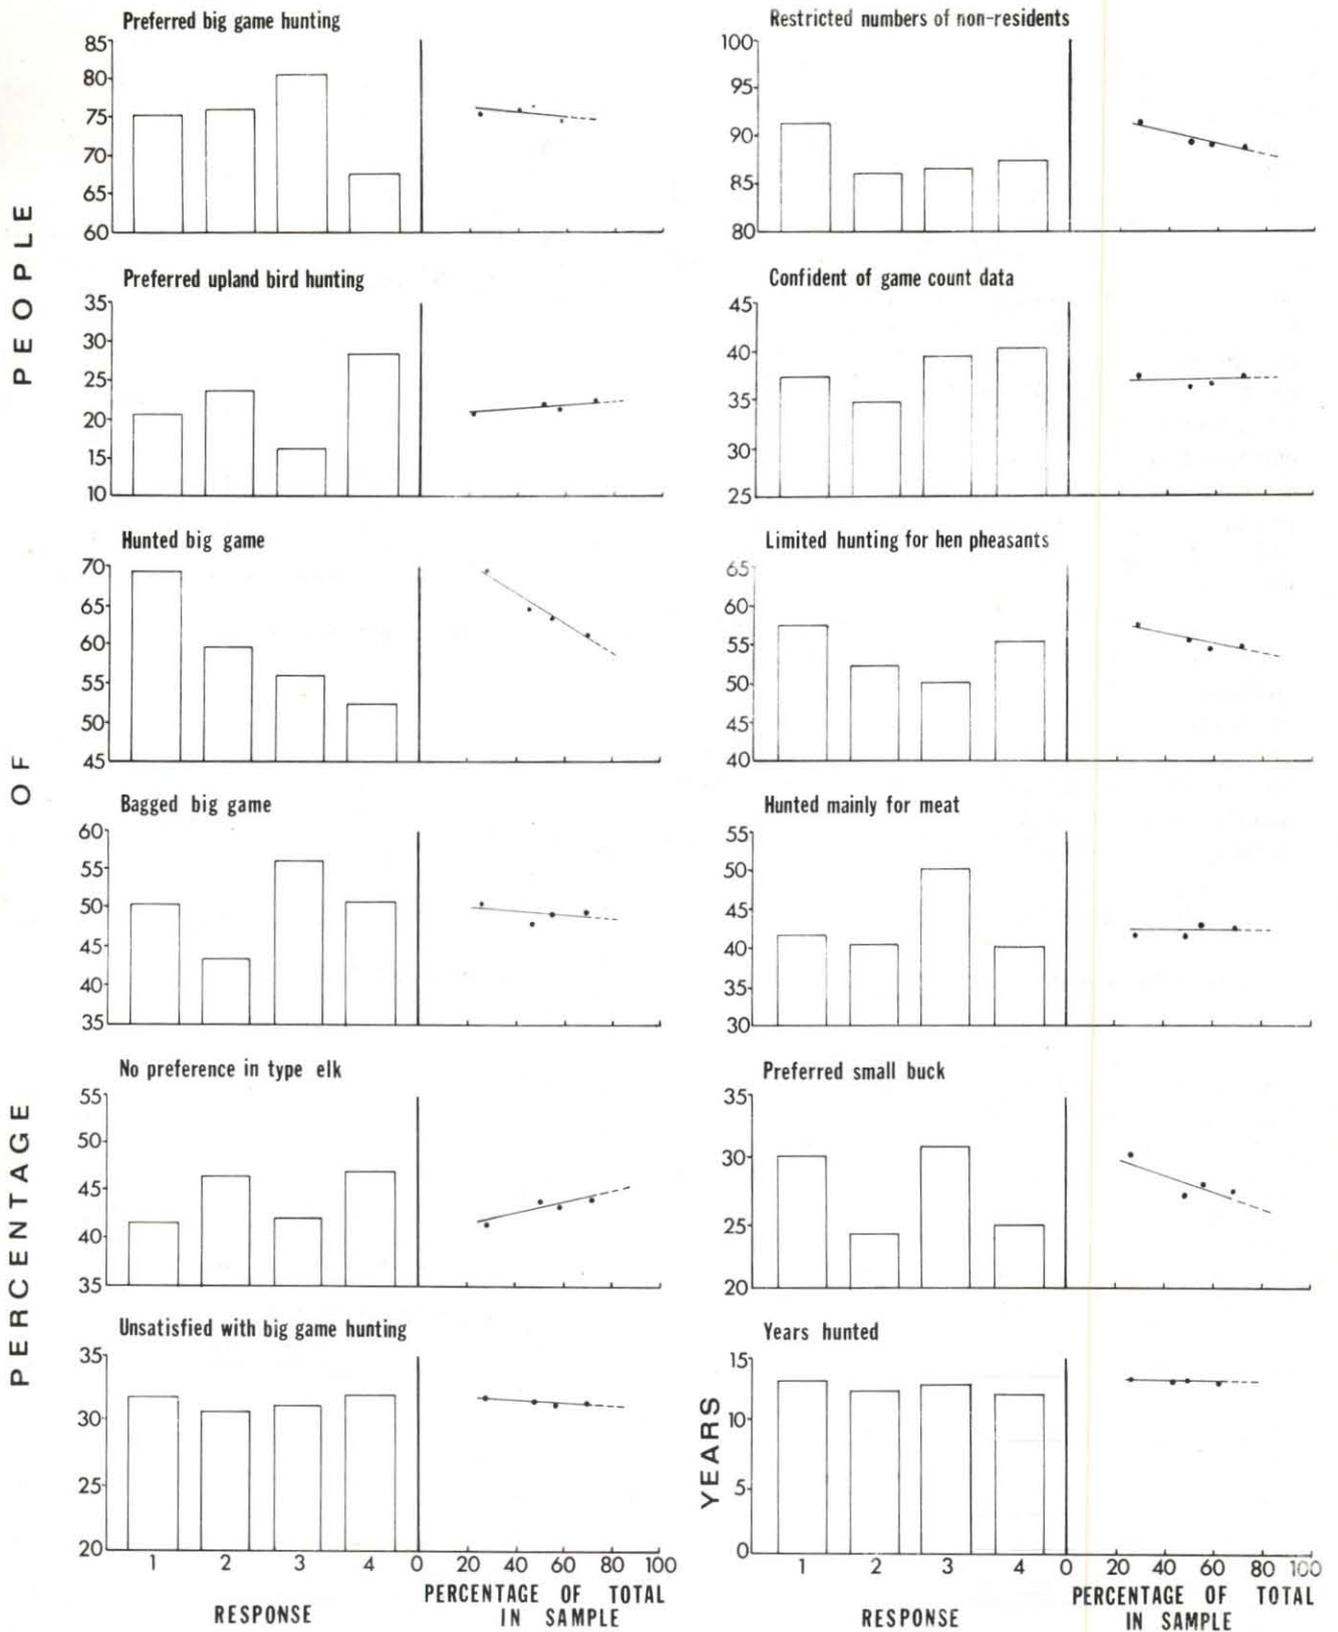

Figure 5. — The percentage of people who preferred big game hunting, etc., for the first, second, third or fourth response and the percentage for the cumulative response expressed as a percentage of the total sample.

The response of people to most questions in the questionnaire did not vary significantly regardless of whether they responded to the initial contact or one of the follow-up contacts (Figure 5). The percentage of people who had hunted for big game (Question 5) varied between the first and latter follow-up contacts. Sixty-nine percent of the people who responded to the first mailing of the questionnaire had hunted for big game in October, but only 52% of the people who responded after the fourth contact (by conservation officers) had hunted. If all people in the sample had responded, our estimated percentage who hunted big game in October would be approximately 55% (by extrapolating the regression line in Figure 5) rather than the 69% reported by respondents to the first mailing.

There were some small differences in responses to the attitude and preference questions between respondents to the first mailing, to all contacts and the projected response from all people in the sample (Figure 5). In all cases the differences in response were small and probably insignificant from a management viewpoint. We did not try to adjust the data for the small differences in non-response bias that might have been present.

### Response by Month

We sampled the hunters after each month of the hunting season primarily to improve the accuracy of the economic data we requested. By asking people to report their expenditures for only the previous month we hoped to avoid the inaccuracies of faulty memory. Some people in the survey reported hunting activity and/or expenditures for months other than for the one requested and we therefore obtained overestimates for the number of days hunted, miles traveled and non-durable expenditures. Because of these overestimates, we did not obtain full benefit from questions 3, 4, 5 and 31 (Figure 1).

We also wanted to see if attitudes and preferences changed during the season. Although there were some small differences in response, as illustrated in Figure 6, the differences were not significant from a management viewpoint. We combined the data for all months in the presentations of responses to the attitude and preference questions presented later in this report.

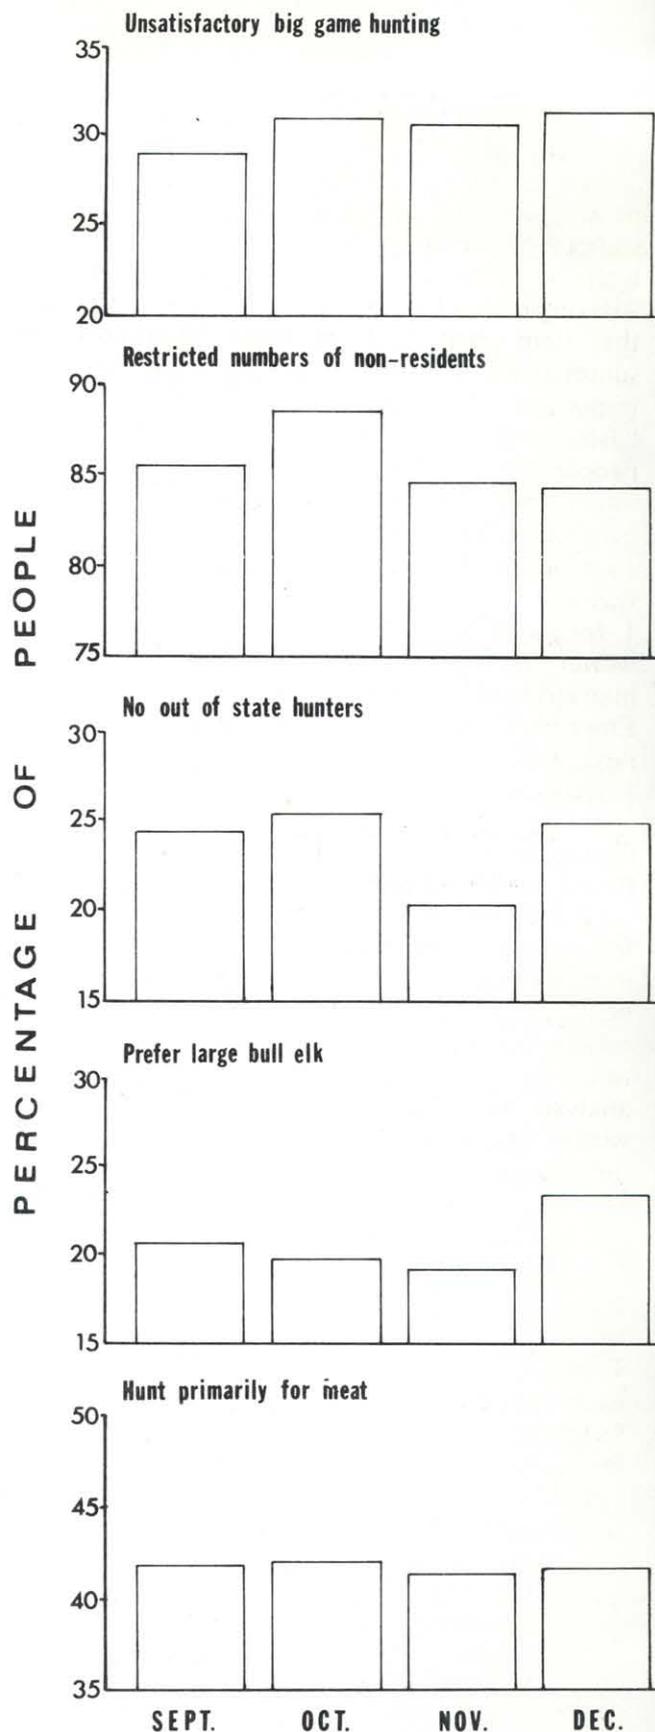

Figure 6. — Examples of the opinions and preferences of residents according to the month of sampling.

## Ranking of Preferences

In some of the questions we asked the people to rank in order of importance their sources of information, reasons for hunting and beliefs regarding management activities. Although we asked for a ranking of 1 to 3, with the item ranked 1 as most important, we summarized the data on the basis of most important (1) rankings. To see if an analysis based on composite rankings of the number of people who ranked each item as 1, 2, or 3 might have yielded different results, we analyzed question 20 (management activities) using composite rankings (Table 6). Law enforcement was the activity most frequently ranked number 1 followed by habitat improvement, emergency winter feeding, acquisition of wildlife areas, management programs, and predator control. Emergency winter feeding was the activity ranked either 1, 2 or 3 by the most people followed by habitat improvement, law enforcement, acquisition of wildlife areas, management programs and predator control. Based on the weighted score, law enforcement would lead as the most important activity followed by emergency winter feeding, habitat improvement, acquisition of wildlife areas, management programs and predator control. The relative importance of the various activities did not change significantly regardless of the analysis we used. Law enforcement, emergency winter feeding and habitat improvement ended up as close contenders for the most important activity ranking in all three methods of analysis.

Table 6. — The number of people who ranked each management activity with a 1, 2 or 3 and a weighted score for each activity obtained by multiplying the number of 1 rankings by 3, 2 rankings by 2, and 3 rankings by 1 and then summing the products.

Activity	Rank 1	Rank 2	Rank 3	Total	Weighted score
Predator control	283	178	193	609	1263

## THE IDAHO HUNTER

### Residence, Age, Sex, Occupation and Income

In 1971, 215,000 people bought licenses to hunt in Idaho. Ninety-one percent of the people were residents and 9% non-residents. Seventy-five percent of the residents who hunted in Idaho resided in the southern part of the state, while 66% of the non-resident hunters lived in surrounding states and California (Table 7). Californians comprised the largest single group of non-resident hunters (47%).

A high proportion of the males in the Idaho population purchased licenses to hunt or fish in 1971 (Table 8). In the age 20-49 age groups three-fourths or more of the males in Idaho purchased licenses in 1971. A large group of resident males with opinions and preferences which differ from those reported in the survey does not exist in Idaho because most males in Idaho older than 20 purchase hunting licenses. Only a small proportion (less than three percent) of the women in Idaho purchased hunting licenses in 1971, so we know little about their opinion and preferences regarding Idaho wildlife.

Table 7. — Residence of persons who purchased licenses to hunt in Idaho in 1971.

Zone of residence	Percentage of resident hunters	Zone of residence	Percentage of non-resident hunters
1. Panhandle	11.6	7. Washington	9.2
2. Clearwater	11.4	8. Oregon	2.4
3. Salmon	2.0	9. California	47.3
4. Southwest	28.1	10. Montana-Nevada	7.0
5. Southcentral	20.9	11. Minnesota-Arizona	4.3
6. Southeast	26.0	12. Wisconsin-Texas	11.3
		13. Michigan-Louisiana	9.7
		14. Maine-Florida	8.8
	100.0		100.0

Table 8. — The number of males of various ages living in Idaho during the 1970 census, males who purchased hunting licenses in 1971 and the estimated percentage of resident males in Idaho who purchased hunting licenses.

Age groups	Males in Idaho	Resident males who purchased licenses	Percentage of males who purchased license
Less than 19	148,160	33,606	22.7
20-29	48,454	40,468	83.5
30-39	37,307	34,310	92.0
40-49	38,126	29,559	77.5
50-59	36,953	22,697	61.4
60 and older	46,750	15,307	32.7

The age distribution of residents who purchased hunting licenses in 1971 differed from the age distribution of males in the Idaho population according to the 1970 census (Figure 7). A smaller proportion of the older members of the population purchased licenses compared to the age groups less than 30 years of age.

Residents who hunted in Idaho were younger on the average than non-residents (Figure 7). Sixty-two percent of the resident hunters were less than 40 years old and 57% of the non-resident hunters were 40 years of age or older.

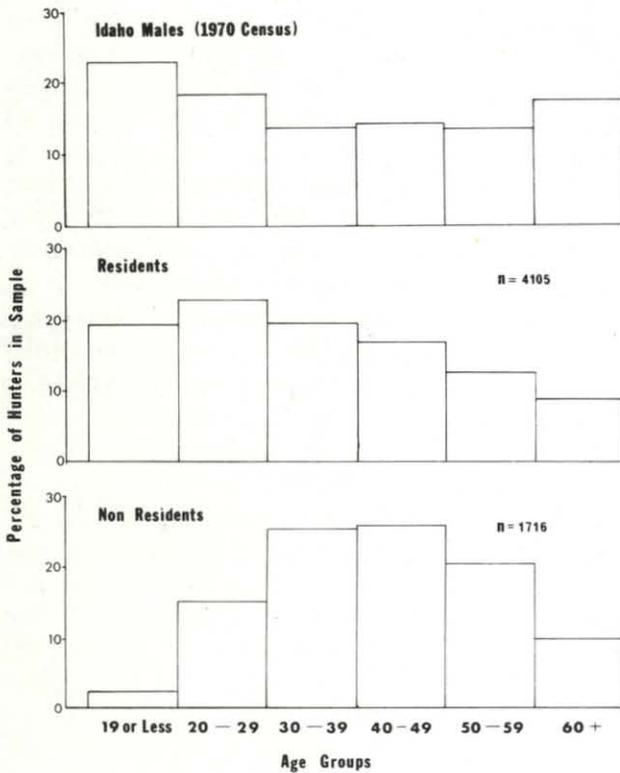

Figure 7. — Age distribution of Idaho males (1970 census), residents and non-residents in 1971 survey.

Hunting in Idaho in 1971 was mostly by males. Ninety percent of the residents and 98% of the non-residents who purchased licenses in Idaho were males.

Most (70%) people who hunted in Idaho had occupations classified as professional, operatives (small shop operators, etc), or craftsmen (Figure 8). The composition of hunters by occupation grouping was similar for both residents and non-residents. People that we classified as having professional or student

occupations made up a larger proportion of the resident license holders than in the male population classified during the 1970 census.

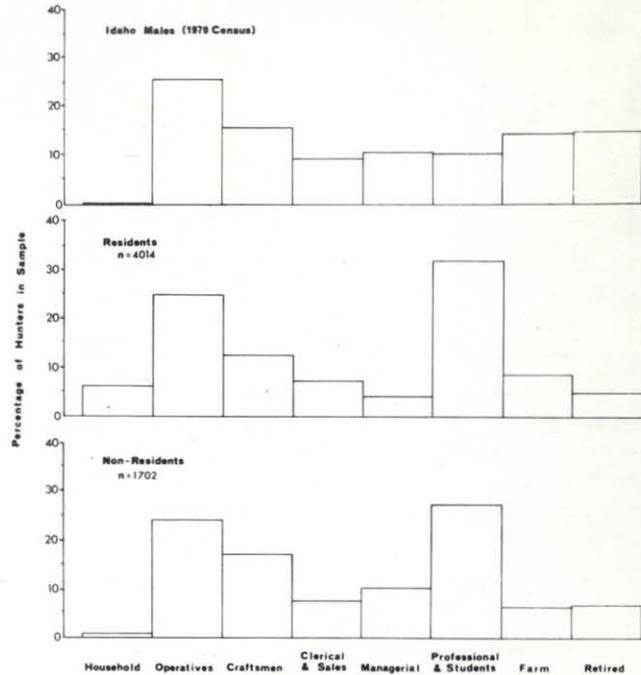

Figure 8. — Percentage of Idaho male (1970 census), residents and non-residents in various occupational groupings in the survey.

The distribution of resident hunters by income group was similar to the distribution nationwide and in Idaho with most people having incomes of \$7-15,000 (Figure 9). The income of Idaho residents was not an important factor in their decision to hunt. Non-residents who hunted in Idaho had larger incomes than resident hunters. The model groups of non-residents had incomes of \$10-20,000. Fifteen percent of the residents had incomes larger than \$15,000 in 1971 compared to 49.5% of the non-residents who hunted in Idaho.

### Distribution of Hunting Effort — 1971

The estimated number of days hunted for the major game species by residents comprised more than 90% of the total days of hunting in 1971 (Table 9, Question 4). Non-residents made up 12% of the elk hunters, put in 8% of the days expended for elk and bagged 17% of the elk killed. Nine percent of the deer hunters were non-residents, they put in 7% of the days hunted for deer and bagged 10% of the deer harvested.

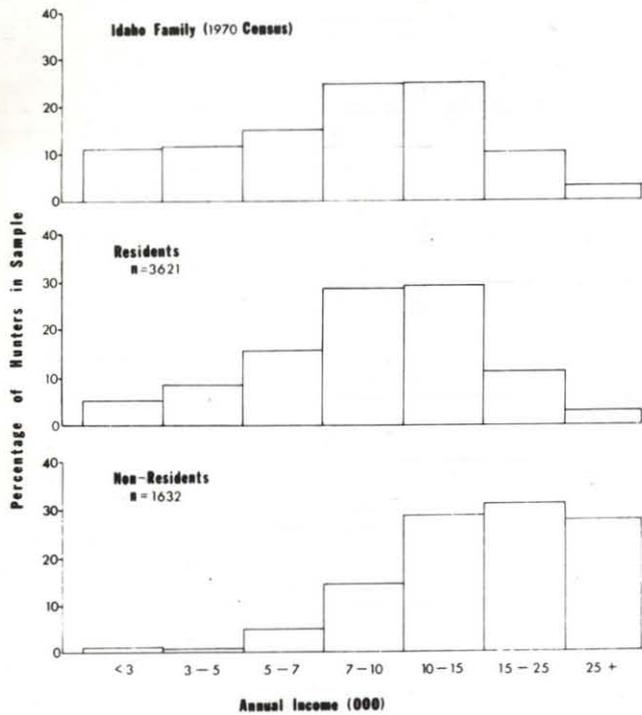

Figure 9. — Percentage of Idaho families (1970 census) and resident and non-resident families in 1971 survey with annual incomes as listed.

Table 9. — The percentage of the estimated total days hunted for elk, deer, pheasants, ducks and forest grouse in Idaho during 1971 by residents versus non-residents.

Game hunted	Percentage of days	
	Residents	Non-residents
Elk	92.1	7.9
Deer	93.3	6.7
Pheasants	95.1	4.9
Ducks	97.4	2.6
Forest grouse	96.9	3.1

Table 10. — The percentage of the estimated total days hunted by residents and non-residents spent on the major game species.

Game hunted	Residents	Non-residents
Elk (and deer incidentally)	24.4	38.7
Deer only	15.0	19.9
Antelope	.4	.2
Pheasants	16.7	16.0
Chukars	5.9	5.3
Quail	3.9	2.6
Forest grouse	9.2	5.4
Ducks	16.8	8.3
Geese	7.7	3.7
	100.0	100.1

Of all the days spent hunting by residents in 1971, one-fourth were put in primarily for elk (with deer incidental) 15% for deer, 17% for each pheasants and ducks and 9% for forest grouse (Table 10, Question 4). Thirty-nine percent of the days spent hunting by non-residents were primarily for elk, 20% for deer and 16% for pheasants.

Residents distributed their hunting for elk throughout the state (Table 11, Question 4). The largest proportion of the days (26%) were hunted in the Clearwater zone followed by the Panhandle, Southwestern and Salmon. The Salmon and Clearwater zones, with only 2.0 and 11.4%, respectively, of the hunter population within the state, accommodated 45% of the days of elk hunting. Non-residents did most of their hunting for elk in the Salmon and Clearwater zones.

Hunting for deer by residents took place closer to home (Table 11). Most of the days non-residents spent hunting for deer only were spent in the Southeastern and Salmon zones.

Most of the days spent pheasant hunting by residents were expended in Southern Idaho (Table 11). Non-residents also hunted mainly in Southern Idaho but they concentrated in the Southcentral zone while residents put in the most days in the Southwestern zone.

The Panhandle zone supported the largest percentage of the days hunted for forest grouse by residents followed by the Clearwater and Southeastern zones (Table 11). Most hunting for forest grouse by non-residents took place in the Clearwater and Salmon zones, the same areas

Most hunting for ducks by residents took place in the Southern zones with 48% in Southwestern Idaho (Table 11). Non-residents expended the largest percentage of days for ducks in the Southeastern zone.

### Years Hunted in Idaho

Most residents had hunted in Idaho six or more years and most non-residents five or fewer years (Figure 10). Nearly half (46%) of the non-residents hunting big game were hunting in Idaho for the first time.

In general, residents who purchased the hunting only license and non-residents who purchased the deer hunting only license had hunted big game fewer years in Idaho than

Table 11. — The percentage of the days hunted by residents and non-residents for elk (primarily but deer also), deer, pheasants, forest grouse and ducks in each zone of the state in 1971 and the distribution of the statewide hunter population.

Species hunted	Percentage in each zone of state						Total percent
	Pan-handle	Clear-water	Salmon	South-western	South-central	South-eastern

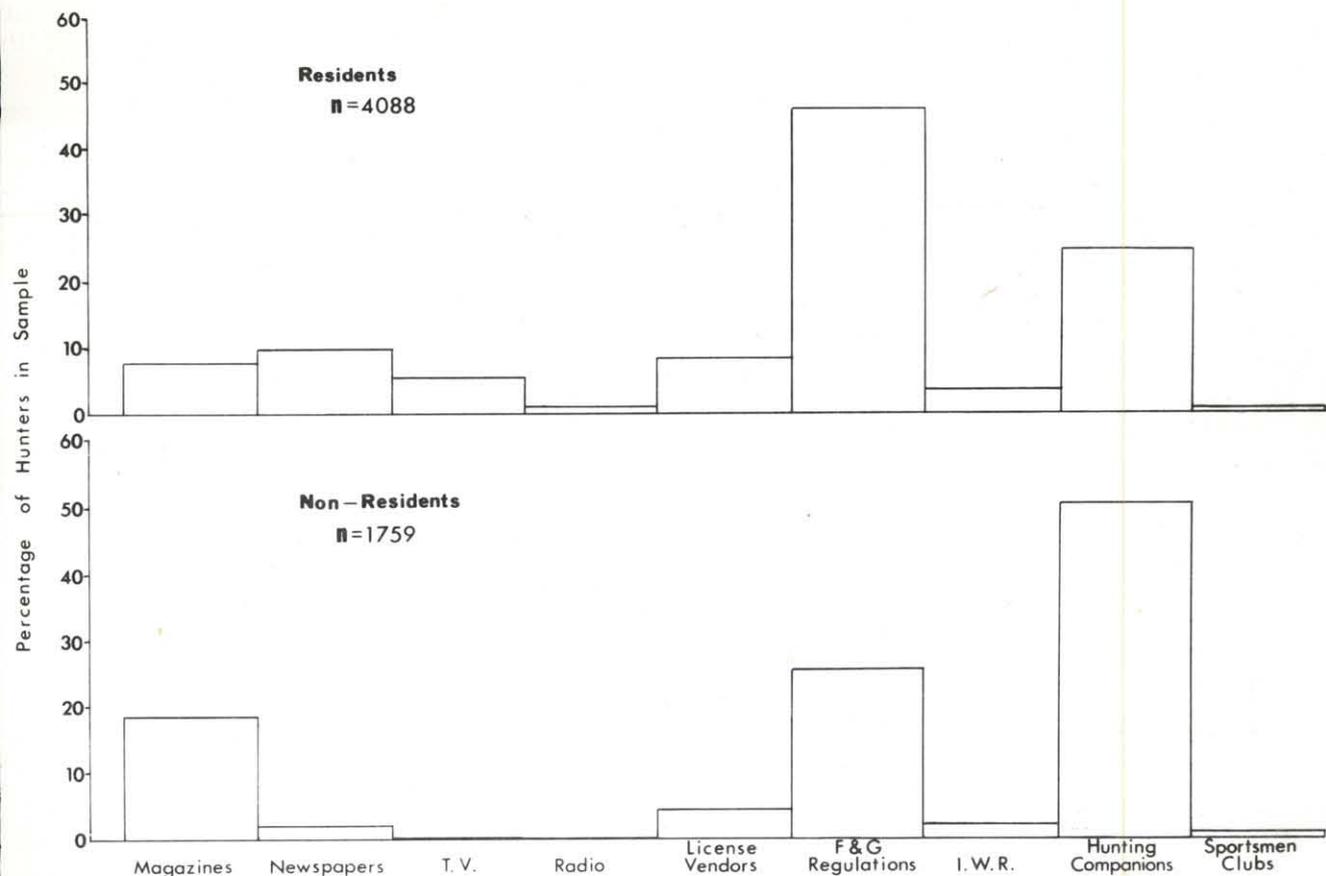

Figure 11. — The percentage of resident and non-resident hunters who ranked magazines, newspapers, etc., as their most important source of information about hunting regulations and wildlife management programs.

### Source of Information on Hunting and Wildlife

People who hunted in Idaho in 1971 received most of their information about hunting regulations and wildlife management programs from Fish and Game Department regulations and hunting companions (Figure 11). Forty-seven percent of the residents thought Fish and Game Department regulations were their most important source of information with 25% relying on their friends and hunting companions. For half the non-residents, their friends and hunting companions were the most important source of information, 25% relied on Fish and Game Department regulations and 18% on hunting and fishing magazines. Few hunters ranked radio, television or the Idaho Wildlife Review as their most important source of information.

The age of hunters and number of years they had hunted had some effect on the sources

of information they considered most important (Table 13). Although hunters in all age groups and with little or much experience thought Department regulations and hunting companions were their most important source of information, more of the older hunters thought newspapers were their most important source of information and they also relied more on Idaho Wildlife Review. Hunters with little or no experience relied more on companions for hunting information than those with 11 or more years of experience.

In the regular survey questionnaire, 5% or less of the respondents ranked "Idaho Wildlife Review," a magazine published bimonthly by the Fish and Game Department, as their most important source of information. In a special survey (Bjornn, 1975) conducted at the same time, 20% of the resident respondents indicated they received the magazine, 32% had read it and 48% had not seen it (Figure 12). The

Table 13. — The percentage of resident hunters who ranked the following sources of information on hunting and fish and wildlife management in Idaho as their most important sources by age group and years of hunting.

Group	Number in sample	Source of Information (%)									
		Magazines	Newspapers	Television	Radio	License vendors	Department regulations	Wildlife Review	Hunting companions	Club meetings	Oth

Years hunted											
1	375	6.6	9.2	6.9	2.0	8.0	38.2	2.9	29.8	.9	3.1
2-5	1096	7.3	8.5	6.1	1.3	7.3	42.5	3.0	28.8	.6	3.7
6-10	696	7.2	7.9	5.0	1.2	6.9	50.7	4.0	23.1	.7	2.4
11+	1735	7.1	11.2	4.2	1.3	9.2	50.7	4.5	20.9	1.3	2.2

subscription list for "Idaho Wildlife Review" contained 22,000 names in 1975 which would amount to 10% of the number of licensed resident hunters. Not all copies of the "Review" go to licensed hunters so that less than 10% of the resident licensed hunters receive a copy. Some people may have considered themselves as receiving the magazine if it came to the household they lived in. If, in fact, 20% of the residents "receive" the "Idaho Wildlife Review" and 30% read it occasionally, it still ranked low as a source of information on hunting and wildlife management programs. We may have contributed to the low rating of the "Review" as a source of information on management programs by the way we worded the question. We would not expect the "Review" to be a top source of information on hunting regulations.

### Reasons for Hunting

In response to the question "Why do you go hunting?" 42.7% of the residents indicated their most important reason was meat (Figure 13). Relaxation, opportunity to get out-of-doors and challenge of the hunt were the primary reasons for most of the remaining resident hunters. Only 1.5% of the resident hunters listed trophy as the most important reason they hunted.

Meat was the main reason for hunting for only 13% of the non-resident hunters (Figure 13). Most non-residents listed relaxation, challenge of the hunt, trophy or opportunity to get out-of-doors as their primary reasons for hunting.

Nearly one-fourth of the non-residents who purchased the big game licenses hunted mainly for a trophy while only 1% of the non-residents who purchased the bird license hunted for a trophy (Table 14).

Nearly 63% of the residents of the Salmon River zone in Idaho hunted primarily for meat compared to only 38% of the residents from southwest and southeast Idaho (Table 14). Few of the residents, regardless of zone of residence, hunted primarily for a trophy. The percentage of non-residents with the combination license from the Montana-Nevada zone who hunted primarily for meat was double (26.7%) the percentage of all non-residents with that license.

Meat was the primary reason for hunting for half the residents, regardless of age, but relaxation, chance to get out-of-doors and

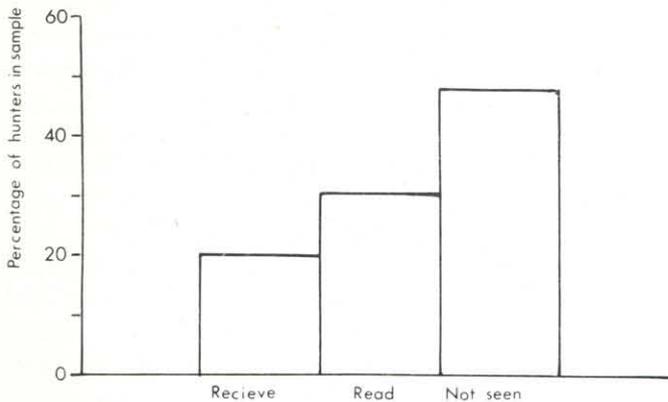

Figure 12. — The percentage of hunters in sample who received "Idaho Wildlife Review," had read it, and who had not seen the magazine.

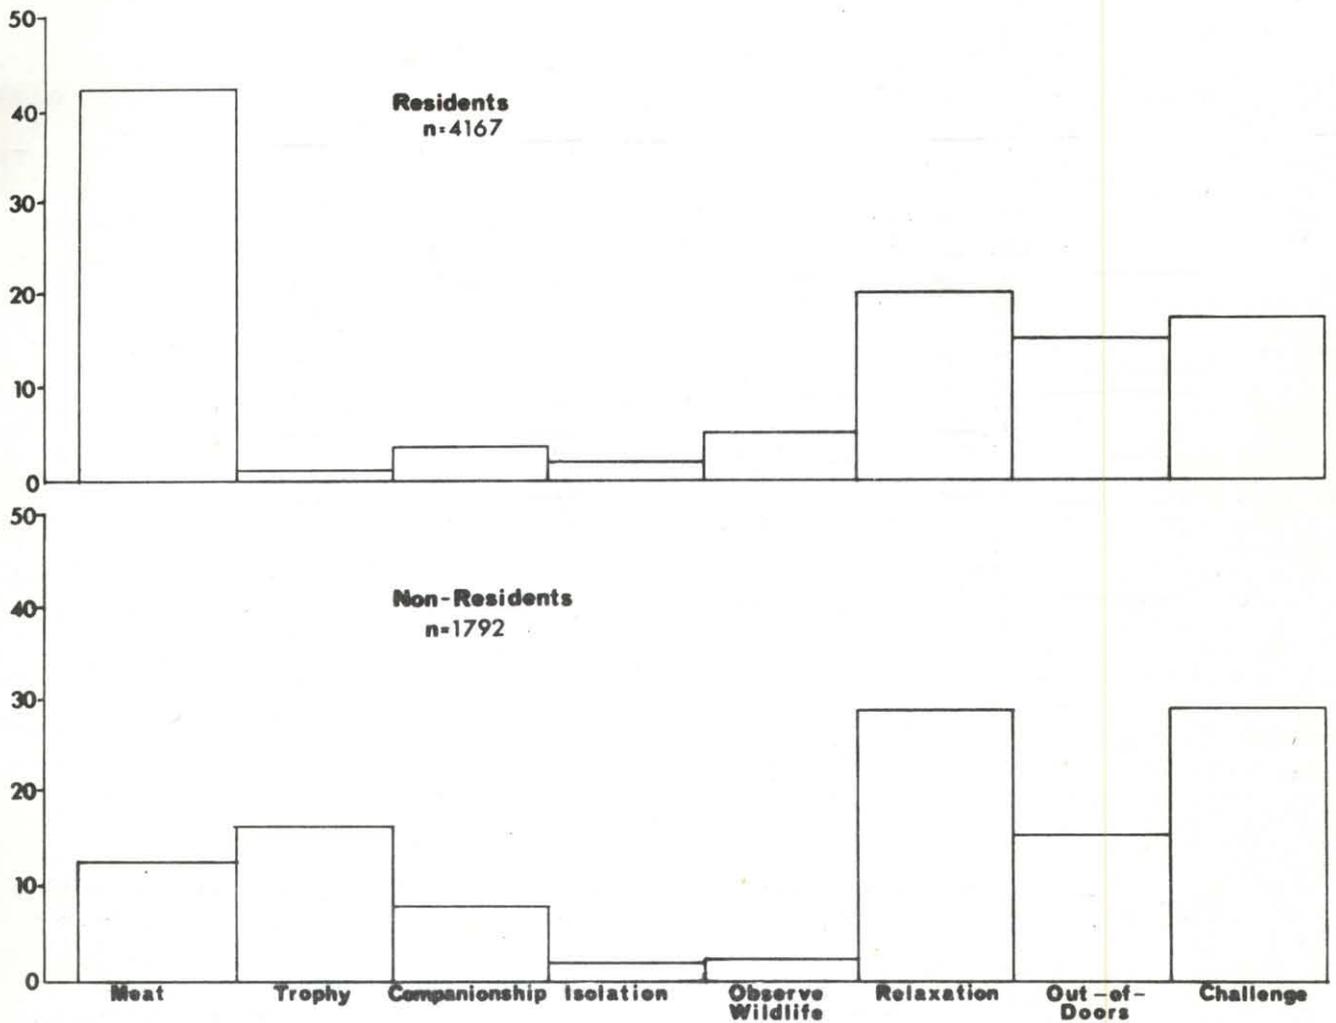

Figure 13. — The percentage of residents and non-residents who listed meat, trophy, etc., as their primary reason for hunting.

companionship were listed by more of the older people in the sample as their primary reasons for hunting (Table 15). Meat was the primary reason for hunting for 47% of the residents who listed big game as the type hunting they preferred but only 23-25% of the residents who preferred upland bird or waterfowl hunting listed meat as the primary reason for hunting.

The groups of hunters who listed their hunting as unsatisfactory in 1971 contained the largest percentage of hunters who hunted primarily for meat. Forty-eight percent of the people who listed their big game hunting as unsatisfactory also listed meat as their primary reason for hunting (Table 15). Thirty-seven percent of the people who listed their big game hunting as excellent listed meat as the most important reason for hunting.

### Type Hunting Preferred

Most residents (73%) listed big game as the type hunting they most preferred (Figure 14). The Panhandle and Salmon River residence zones contained the largest percentage of people who preferred big game hunting (88%) compared to 63-65% of the people in southwest and southcentral Idaho. One-fourth of the hunters in southwest and southcentral Idaho preferred upland bird hunting compared to only 8 and 11 percent of those from Panhandle and Salmon zones. Southwest Idaho had the largest percentage of people who preferred to hunt waterfowl (12%) and the Salmon zone had the least (1%).

Residents who purchased the combination or hunting only licenses differed little, if at all,

Table 14. — The percentage of people in the sample who listed meat, trophy, etc., as their most important reasons for hunting in Idaho.

License class and zone of residence	Number in sample	Reason for hunting (% of people)

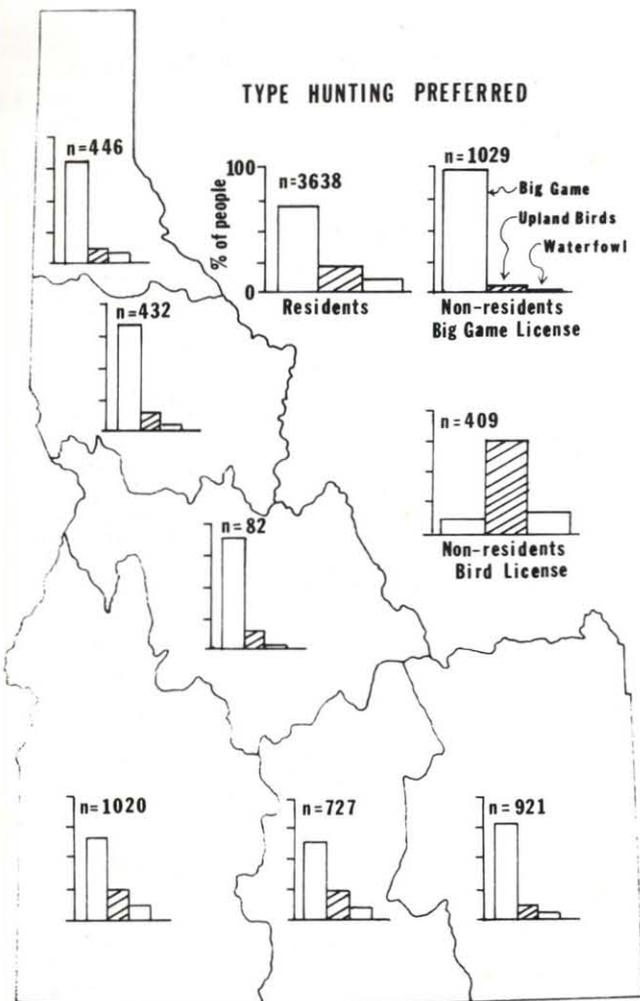

Figure 14. — The percentage of residents by residence zone and non-residents by type of license who ranked big game, upland bird or waterfowl as the type hunting they most preferred.

in the type hunting they preferred (Table 16). Non-residents who purchased the combination and deer license were mostly people who preferred to hunt big game (96-97%). Seventy-five percent of the non-residents who purchased the upland bird license preferred to hunt upland birds (15%) waterfowl and (12%) big game.

Seventy-three percent of the resident hunters ranked big game as their preferred type of hunting. Small business operators (82%), craftsmen (80%), farmers (78%) and retired people (76%) had larger than average percentages of people who preferred big game hunting while clerical and sales and professional

occupations had only 62% who preferred big game hunting. Upland game birds were listed as the preferred type of hunting by 19% of all occupations but ranged from 12% among the small business operators to 29% of those in the clerical and sales occupations. Waterfowl as the preferred type hunting ranged from 3% in the household occupations to 15% in the professional groups (Table 17).

### Preferred Species and Type Animal

Fifty-seven percent of the residents on a statewide basis listed deer as their preferred species of big game (Figure 15). In the Panhandle and Clearwater zones in north Idaho 65 and 60%, respectively, of the residents listed elk as their preferred big game animal. In south Idaho most people (61-68%) preferred deer.

Most non-residents (80%) who purchased the combination license preferred to hunt elk while 74% of those who had the deer license listed deer as the big game animal they preferred (Figure 15).

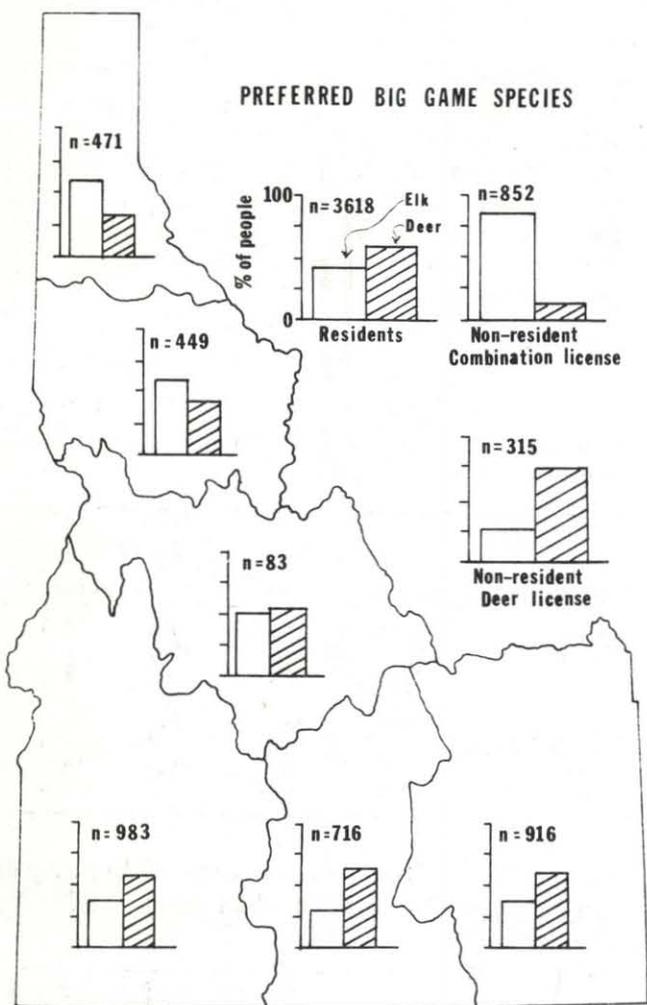

Figure 15. — The preferred species of big game of residents statewide and within each residence zone and of non-residents who purchased the combination and deer licenses in 1971.

For the entire state, 67% of the residents listed pheasants as the upland bird species they preferred (Figure 16). Forest grouse were preferred by the largest percentage of people in the Panhandle and Salmon zones with pheasants the most preferred species by most people in the other zones. Chukars were most popular in the Salmon and southwest zones. Only a few people listed quail as their most preferred species.

Most residents and non-residents listed ducks as their preferred type of waterfowl (Table 18). A larger percentage of the people who purchased the combination licenses preferred geese compared to those with the hunting only or bird licenses.

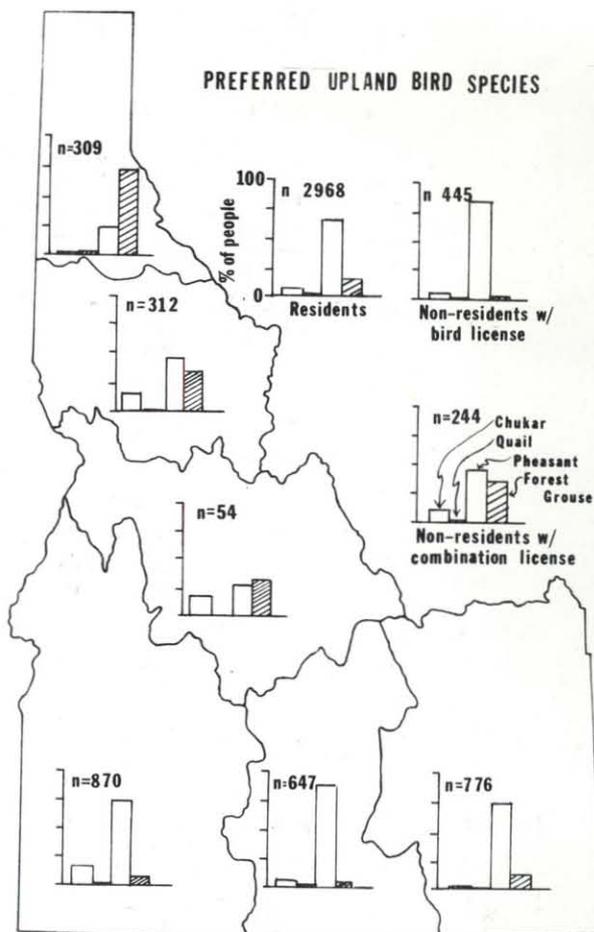

Figure 16. — The preferred species of upland birds of residents on a statewide basis and each zone of residence and of non-residents with the combination and bird licenses in 1971.

Table 18. — The preferred species of waterfowl of resident and non-resident hunters.

Residence and license	Number in sample	Percentage who preferred	
		Ducks	Geese
<u>Residents</u>	2153	73.8	26.2
Combination	1435	71.6	28.4
Hunt only	718	77.6	22.4
<u>Non-residents</u>			
Combination	141	64.8	35.2
Hunt only	192	77.0	23.0

A large percentage of the resident hunters indicated they had no preference in the type of deer, elk or antelope they killed (Figure 17).

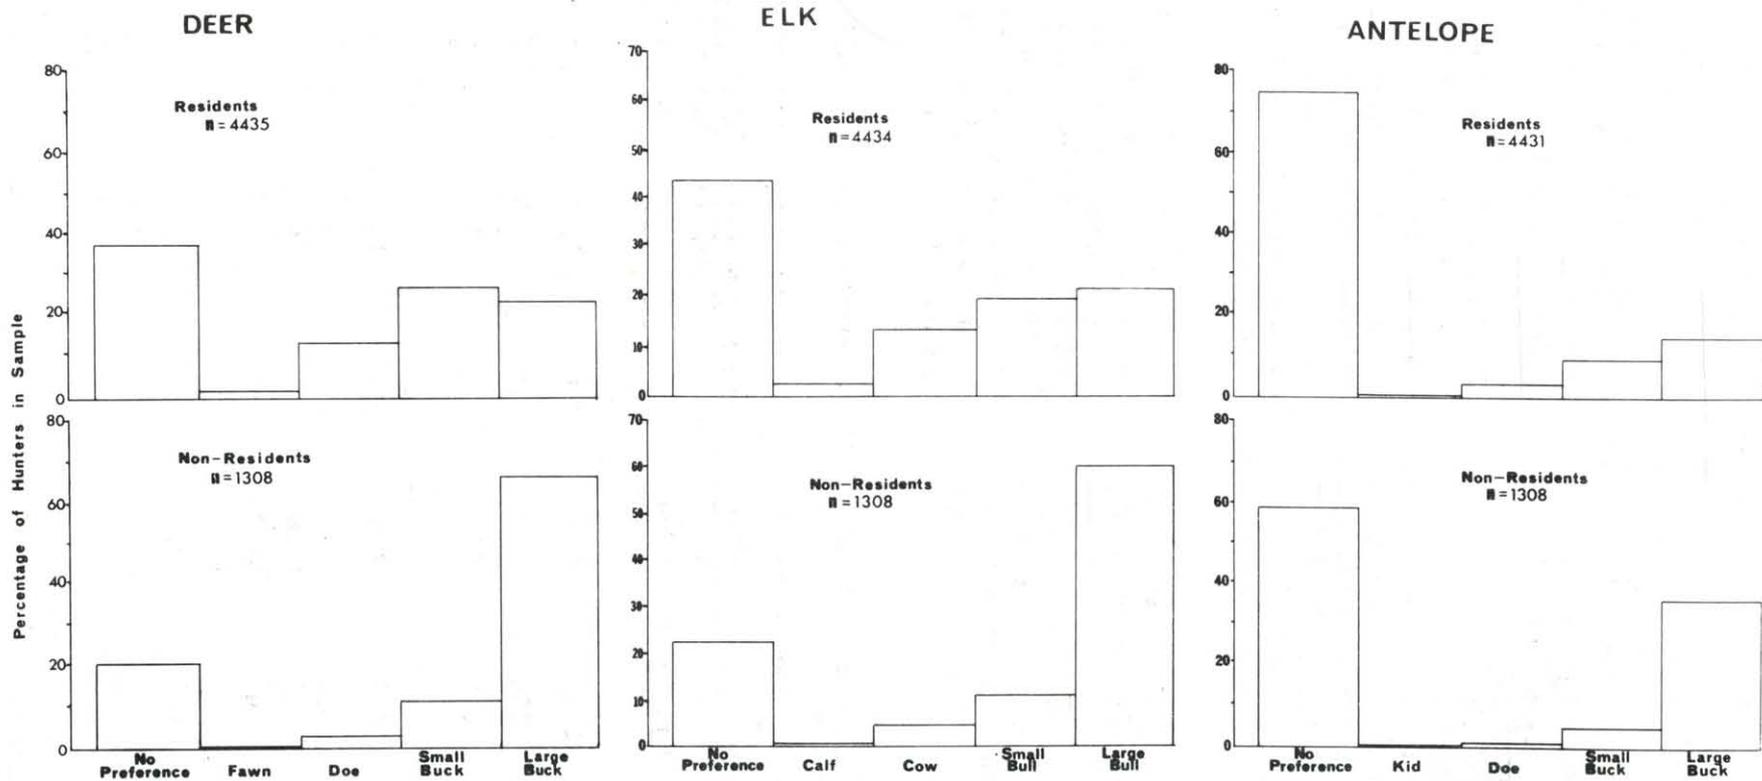

Figure 17. — The percentage of residents and non-residents who preferred various types of animals when hunting deer, elk, and antelope.

The relatively small percentage of residents who preferred a large buck or bull and the large percentage who had no preference is an additional expression that many residents were hunting primarily for meat. Most non-residents (66%) on the other hand, listed a preference for a large buck or bull a further expression that obtaining a trophy was a primary reason for hunting for many out-of-staters.

Among non-residents, more people with the combination license preferred a large bull than people with the deer license (Table 19). A large proportion of the non-residents with the deer license indicated no preference in type of elk they preferred, but many wanted a large buck.

Many residents hunting elk or deer for the first time indicated no preference in the type animal they bagged while the percentage of hunters which preferred a cow or small bull elk or small buck deer increased with more years of hunting (Table 20). These preferences again reflected the desire of residents to obtain good meat rather than a trophy.

There was no clear relationship between the degree of satisfaction with big game hunting and the type animal residents preferred (Table 20). The group of people who classed their hunting as excellent contained the largest percentage of people who preferred a large buck or bull, but the differences were small.

Residents from the six zones in Idaho differed some in the type deer or elk they preferred (Table 16). More of the residents from the Salmon zone preferred a small buck deer or small bull elk compared to people from the other zones. Southeast and southcentral residents had more people that preferred large bucks or large bulls.

When we compared the type animal residents preferred with their primary reason for hunting (Table 16) only the people who were hunting primarily for a trophy had a markedly different preference for the type animal they bagged. As expected, 77% of the trophy hunters preferred a large buck deer and 64% preferred a large bull elk.

Table 19. The type of big game animal the people preferred to kill.

## Satisfaction with Hunting

A majority of hunters (especially those with an opinion) ranked their hunting in Idaho as either satisfactory or excellent (Figure 18). Nearly one-third of the hunters ranked their big game hunting as unsatisfactory but less than 14% listed upland bird or waterfowl hunting as unsatisfactory. Satisfaction with hunting did not vary significantly between residence zones in Idaho.

A larger proportion of the non-residents who came to Idaho primarily for upland bird hunting ranked their bird hunting as excellent compared to the opinions of resident hunters (Table 21). The proportion of residents and non-residents who were satisfied or unsatisfied with their big game and waterfowl hunting was similar. Most non-residents who purchased the combination license had no opinion on satisfaction with upland bird or waterfowl hunting.

Satisfaction with hunting for Idaho residents was influenced by participation and success (Table 22). Twenty-two percent of the residents who hunted big game and bagged an animal (no difference between deer or elk) ranked their hunting as excellent compared to 10% of those who hunted but did not bag an animal. Twenty-seven percent of the people who hunted and bagged an animal still considered their hunting as unsatisfactory.

Table 21. — The degree of satisfaction of people who purchased licenses to hunt big game, upland birds and waterfowl in Idaho in 1971.

Type hunting, residence and license	Number in sample	Degree of satisfaction (% of people)

Geese	95	8.3	34.0	53.2	4.1

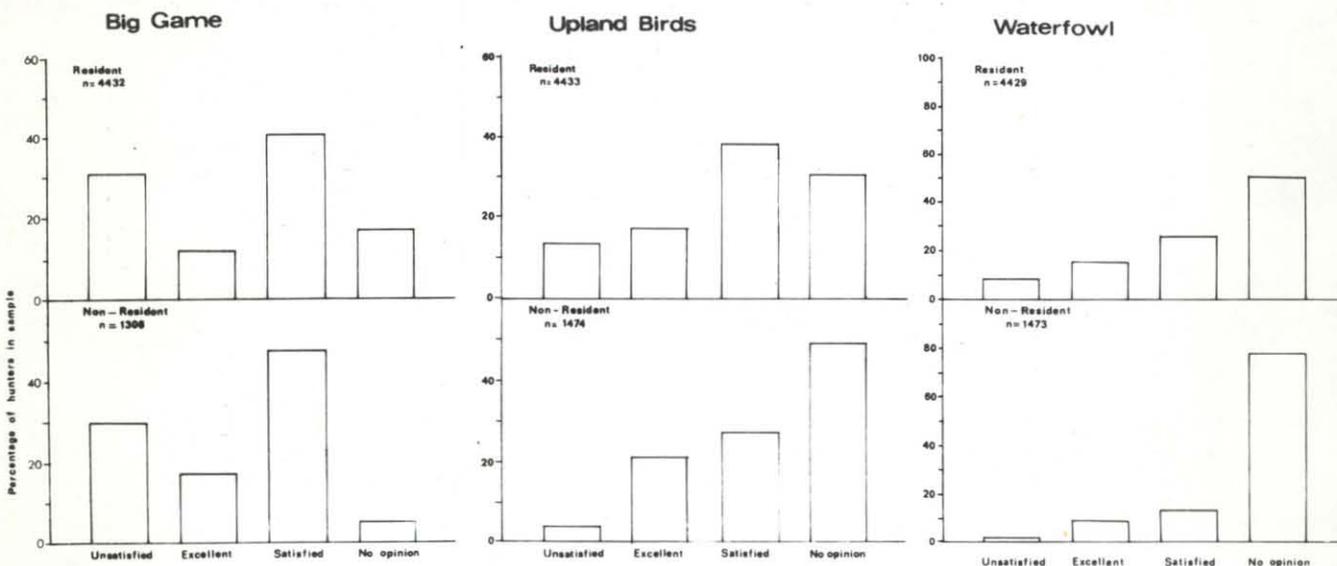

Figure 18. — The degree of satisfaction of residents and non-residents with their hunting in Idaho.

Satisfaction with upland bird hunting for residents was related to the number of birds they bagged (Table 22). Twenty-one percent of the hunters who bagged one bird ranked their hunting excellent while 51% of those who bagged 11 or more birds considered their hunting excellent. Most people who hunted waterfowl considered the hunting as excellent or satisfactory and groups who bagged ducks or geese had similar proportions in each satisfaction ranking.

More of the hunters who had hunted 11 or more years for big game, upland birds or waterfowl ranked their hunting as unsatisfactory and fewer had excellent hunting compared to those who had hunted fewer years (Table 23). The largest shift in satisfaction with hunting and years hunted occurred among big game hunters.

### Reasons for Dissatisfaction

Most resident hunters listed lack of game, too many hunters and not bagging game as the primary reasons for their dissatisfaction with

hunting in Idaho in 1971 (Table 24). A few residents were dissatisfied with their hunting because of weather and access problems, particularly the upland bird and waterfowl hunters.

Table 23. — The degree of satisfaction with hunting in Idaho of resident hunters based on years of hunting.

Birds	169	6.0	18.6	26.8	24.6	0.5	23.5
<b>Waterfowl</b>							
Residents	990	14.5	28.2	24.3	27.5	0.0	15.5
Non-residents	103	16.1	8.1	23.4	25.1	0.3	20.0
Combination	30	17.5	2.8	25.5	29.7	0.5	12.7
Birds	73	13.9	16.5	20.3	17.7	0.0	31.7

Forty percent of the big game hunters who listed a reason for dissatisfaction ranked lack of game as the primary cause. Too many hunters was the main problem for 28% of the unsatisfied big game hunters and failure to bag a big game animal was listed as the primary cause of dissatisfaction by another 20%. Access and outfitter and guides were not a problem to residents who hunted big game.

Of the upland bird hunters who listed reasons for dissatisfaction with hunting, 37% ranked an excessive number of hunters as their most important reason, 34% listed lack of birds and 10% were unhappy because they did not bag some birds. Weather and access problems were the main cause of dissatisfaction for the remaining 19% of the residents.

An excessive number of hunters led to dissatisfaction for 28% of the residents who hunted waterfowl, 24% listed lack of waterfowl and 15% failure to bag waterfowl as the primary causes of their dissatisfaction. Eighteen percent of the waterfowl hunters reported weather as their primary cause for dissatisfaction and 16% listed access.

Many non-residents also listed lack of game and failure to bag game as a primary cause for dissatisfaction while hunting in Idaho but fewer non-residents than residents listed an excessive number of hunters as the main cause for dissatisfaction (Table 24). More non-residents than residents listed weather, access and outfitter and guides services as primary reasons for dissatisfaction with hunting in Idaho.

Lack of game and failure to bag a big game animal were the primary reasons for dissatisfaction listed by non-residents who hunted big game. Thirty-two percent of those with the combination license listed lack of game as the primary cause for dissatisfaction, 26% listed failure to bag an animal, 25% weather, 11% outfitter and guide services, 5% excessive numbers of hunters and 2% access. Non-residents with the deer license listed lack of game and failure to bag game more often than those with the combination license and they listed weather and outfitter and guide services less often.

Access was listed by 24% and 32% of the non-residents with bird licenses as the primary problem which caused their dissatisfaction with upland bird and waterfowl hunting, respectively (Table 24). Non-resident bird hunters also listed

lack of birds, too many hunters and weather as causes for their dissatisfaction with bird hunting in Idaho in 1971.

### Confidence in Game Counts and Harvest Estimates

Nearly half the residents and one-fourth of the non-residents lacked confidence in the game count and game kill information provided by the Idaho Fish and Game Department (Figures 19 and 20). About one-third of the residents and nearly 40% of the non-residents had confidence in the figures with about 15% of the residents and 35% of the non-residents without an opinion on the subject.

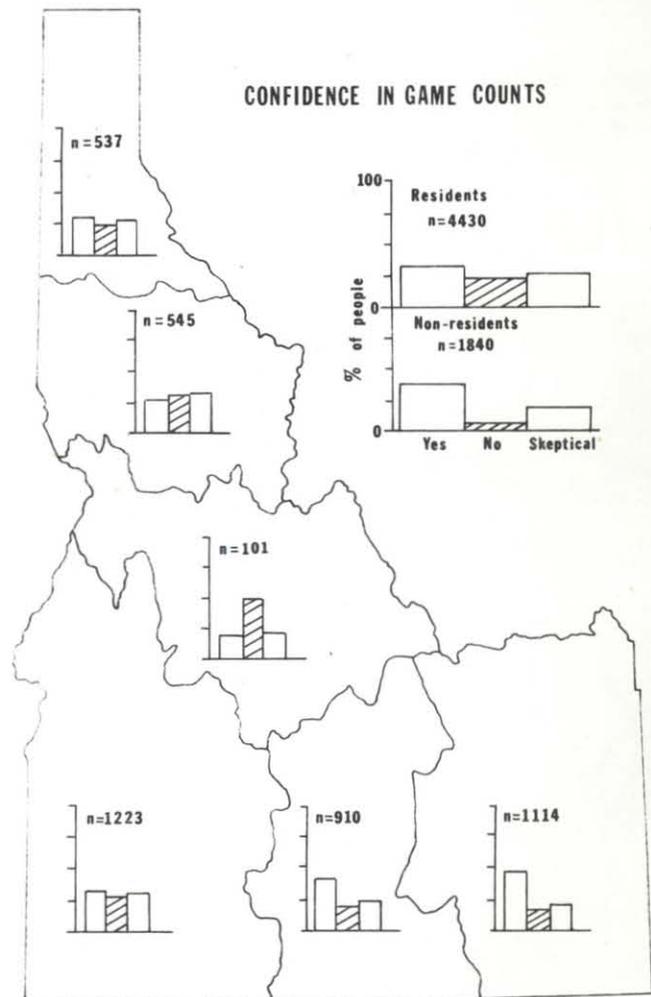

Figure 19. — The percentage of people who did, did not have confidence, or were skeptical of Idaho Fish and Game Department game counts. Those with no opinion excluded from figure but comprise remainder of 100%.

The percentage of residents who had confidence in the Department's game count and kill information varied throughout the state (Figures 19 and 20). The southeast and southcentral zones of the state had the largest percentage of people with confidence in the count and kill data (37-46%) and the Salmon (19-21%), Clearwater (27%) and Panhandle (25-33%) zones had the smallest percentage of people. People in the Salmon and Clearwater zones were particularly skeptical of the game count data with 72% and 57% of the hunters from those zones, respectively, expressing no confidence or skepticism in the count data.

Confidence in Department game counts and harvest figures was highest among the youngest

age group of hunters (Table 25). Nearly half the residents in the less than 20 age groups expressed confidence in the counts and 43% in the kill data. The age groups over 20 all contained similar proportions of people with confidence in the Department data.

People who preferred big game hunting had the least confidence in the count and kill data and upland bird hunters had the most confidence (nearly half the people) (Table 25). Only one-third of the big game hunters had confidence in the game count and harvest data and 68% had no confidence or were skeptical. Waterfowl hunters who expressed no confidence or skepticism outnumbered those with confidence in the data.

The group of hunters who rated their hunting as excellent contained the largest percentage of people with confidence in the game count and harvest data while those who rated their hunting as unsatisfactory had the least people with confidence (Table 25). Sixty-percent of the people who rated big game hunting as excellent had confidence in game counts compared to 32% who expressed lack of confidence or skepticism. Only 20-21% of the big game hunters who rated their hunting as unsatisfactory expressed confidence in the Department's figures.

## OPINIONS OF IDAHO HUNTERS

### Satisfaction with Management

A majority of the residents and non-residents, who had an opinion, thought Idaho Fish and Game Department personnel were doing a satisfactory job of managing the major wildlife species in Idaho (Table 26, Question 21). For some species of wildlife many of the people (up to 51% of the residents) had no opinion on the Department's performance in managing the wildlife.

Although a majority of the residents with an opinion thought Department personnel were doing a satisfactory job of managing Idaho wildlife, 34% (42% of those with an opinion) thought they were not doing a satisfactory job of managing deer, 38% (49% of those with an opinion) were not satisfied with the management of elk and 20% (29% of those with an opinion) wanted better management for pheasants (Table 26). Most residents who had an

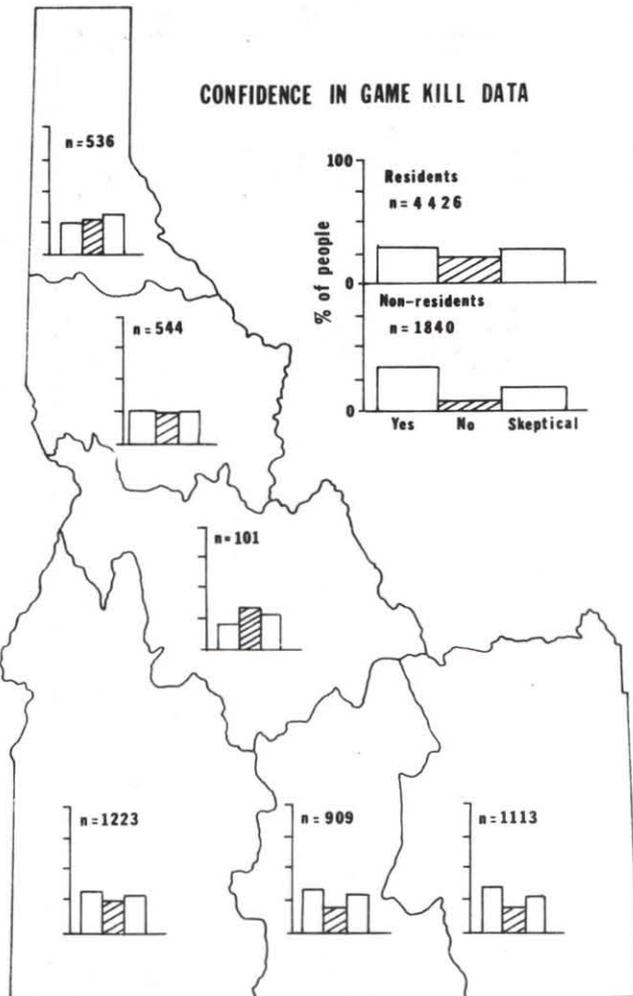

Figure 20. — The percentage of people who did, did not, or were skeptical of Idaho Fish and Game Department kill information. Those with no opinion excluded from figure but comprise remainder of 100%.

Table 25. — The percentage of resident hunters who did or did not have confidence in the game counts and harvest figures released by the Idaho Fish and Game Department grouped by age, preferred type of hunting and satisfaction with hunting.

<b>Waterfowl</b>	4430	49.0	9.9	563	43.2	6.8

opinion were satisfied with the Department's management of trophy animals, antelope, sage grouse, forest grouse, chukar, partridge and waterfowl.

The proportion of residents who thought personnel of the Fish and Game Department were doing a good job of managing wildlife in Idaho varied between the zones of the state (Table 27, Question 21). A majority of the residents with an opinion in the Salmon and Southwestern zones thought Department personnel were not doing a good job of managing deer. The Department's management of elk was not satisfactory for a majority of the residents who had an opinion in the Clearwater, Salmon and Southwestern zones.

The number of years of hunting experience was a factor in the proportion of residents who had an opinion on the Department's management of wildlife in Idaho (Table 28, Question 21). Residents with 11 or more years of experience hunting big game were evenly split on the Department's management of deer (44% satisfied and 44% not satisfied). Nearly half were not satisfied with the management of elk.

Most residents with only a few years of hunting experience approved of the Department's management of all wildlife species.

A large percentage of the residents who listed their big game, upland bird or waterfowl hunting as unsatisfactory also thought Department personnel were not doing a satisfactory job of managing deer, elk, pheasants and waterfowl (Table 29, Question 21). Most people who listed their hunting as excellent or satisfactory thought the Department was doing a satisfactory job of managing all the wildlife species.

#### Non-resident Hunters in Idaho

In recent years, many residents of Idaho have expressed concern about the number of non-resident hunters allowed to hunt in Idaho. The number of non-residents who purchased licenses to hunt big game in Idaho reached a peak in 1969 when 14,325 people purchased the combination license and 4,569 purchased the deer only license (Table 30). In 1969, non-residents comprised 11.5% and 16.7% of the

deer and elk hunters in Idaho, and harvested 11.9% and 20.3% of the deer and elk, respectively. In 1971, the Idaho Fish and Game Commission limited the sales of non-resident combination licenses (elk and deer) to 5% of the total resident hunting license sales for the previous year and sales of deer only licenses to 2% of resident sales.

Sales of non-resident licenses for bird hunting had not been restricted by the Idaho Fish and Game Commission. The number of

non-residents who hunted birds (primarily pheasants) in Idaho increased only 300 from 1969 to 1973 (Table 30).

**Restriction of the number of non-resident hunters** — Most resident hunters (86%) answering the questionnaire indicated a preference to restrict the number of out-of-state hunters in Idaho (Table 31, Question 10). Only 3% of the resident hunters expressed a willingness to allow unrestricted numbers of out-of-staters to hunt in Idaho and 11% had no opinion on the question. Resident hunters who purchased either the combination or hunting only licenses did not differ in their preferences regarding the restriction of out-of-state hunters. The preference to restrict out-of-state hunters in Idaho was consistent in all zones of the state.

Half of the out-of-state hunters thought Idaho should restrict the number of non-resident hunters (Table 31). One-fourth of the non-residents indicated Idaho should allow unrestricted numbers of out-of-staters to hunt in Idaho and the other fourth had no opinion on the question.

More of the non-residents who hunted big game (combination and deer only) thought Idaho should restrict out-of-state hunters than those who hunted upland birds or waterfowl (Table 31). The proportion of out-of-staters who thought Idaho should restrict out-of-state hunters also varied by residence zone. A large percentage (72% of those with the combination license and 85% with the deer license) of the non-residents who came from Zone 10 (Nevada, Utah, Wyoming and Montana) who hunted big game in Idaho and had an opinion thought that Idaho should restrict out-of-staters. Only 44% of the out-of-staters from Zone 10 who purchased the bird license and had an opinion thought Idaho should restrict the number of out-of-state hunters.

The attitude that Idaho should restrict the number of out-of-staters who hunt in Idaho was consistent throughout all categories of residents (Table 32). Approximately 90% of the residents wanted out-of-staters restricted regardless of type hunting preferred, reason for hunting, occupation, income, satisfaction with hunting, reason for dissatisfaction or hunting success of the residents. Residents who listed their competition with non-residents while big game hunting as "not noticeable" had a smaller

proportion of people (82%) who favored restricting non-residents than those who thought competition existed. Nearly all of the residents (94%) who were dissatisfied with big game hunting because of "too many hunters" wanted the number of out-of-state hunters restricted. The attitude of residents regarding the restriction of non-resident hunters was similar

for upland bird and waterfowl hunting groups so we listed only the groupings for big game under competition experience, reasons for dissatisfaction, hunting participation and success and satisfaction with hunting.

We also asked people who wanted to restrict the number of non-resident hunters to indicate the manner in which they wanted them

Table 30. — The number of residents and non-residents who purchased licenses to hunt in Idaho, percentage of deer and elk hunters who were non-residents and the percentage of deer and elk harvested by non-residents.

Year	Resident licenses sold		Non-resident licenses sold			Non-residents (% of total)

restricted. Twenty-nine percent of the residents preferred to restrict out-of-state hunters to areas where residents did not adequately harvest the game and 71% wanted to limit the number to a proportion of all hunters (Table 33, Question 10). Nine percent of the people were willing to allow non-residents to make up 20% of all hunters, 19% would allow 10% of the hunters to be non-residents, 27% wanted only 5% non-residents and 17% wanted no non-resident hunters in Idaho. If we assume residents could

adequately harvest the game from all areas of the state then 45% of the resident hunters would prefer that no out-of-staters be allowed to hunt in Idaho and 72% think non-residents should make up no more than 5% of the hunters.

Non-residents differed from residents in the proportion of hunters they thought non-residents should comprise (Table 33). Forty-nine percent of the non-residents thought out-of-staters should make up at least 20% of all Idaho hunters. Only 1% of the non-residents thought Idaho should exclude all non-resident hunters.

The percentage of residents who wanted to limit out-of-state hunters to less than 5% of all hunters did not vary significantly between hunters who preferred big game, upland bird or waterfowl hunting (Table 34). More of the residents who were unsatisfied with their hunting wanted out-of-staters restricted in number to a smaller proportion of all hunters than hunters who ranked their hunting satisfactory or excellent.

**Commission policy on limitation of non-residents** — Nearly 50% of the residents thought the Idaho fish and Game Commission should allow fewer non-residents than their 1971 policy (Table 35). Less than 2% of the residents wanted more out-of-state hunters than the policy allowed and 19% thought the number allowed was about right. Seventeen percent of the people indicated they did not know the Commission's policy and 15% had no opinion.

Table 32. — The attitude of residents regarding the restriction of out-of-state hunters in Idaho, when grouped by type hunting preferred, reason for hunting, occupation, income, competition experience with non-residents, reason for dissatisfaction, hunting success and satisfaction with hunting.

Group	Number in sample	Attitude toward restriction (% of people)

Table 33. — The type restriction of non-resident hunters preferred by residents and non-residents who thought Idaho should restrict the number of out-of-state hunters.

	Residents	Non-residents
Number in sample	3841	892
<b>Type restriction</b>		
Restrict to certain areas	28.6%	22.0%
Restrict to proportion of all hunters	71.4	78.0
20% of all hunters	9.2	49.4
10% of all hunters	18.9	20.9
5% of all hunters	26.7	6.5
0% of all hunters	16.6	1.2

Only 7% of the non-residents thought the Commission should have allowed fewer out-of-state hunters, 15% wanted more non-residents, 39% thought the Commission allowed the correct number and 18% didn't know the policy (Table 35).

Residents who reported objectionable competition with non-residents while hunting in 1971 were more inclined to think the Commission should have allowed fewer out-of-state hunters (Table 36). Eighty-one percent of the residents who reported "too much" competition with non-resident hunters thought the Commission should have reduced further the number of out-of-state hunters. Less than 40% of the residents in the other competition categories wanted fewer non-resident hunters.

**Competition with out-of-state hunters** — Forty percent of the residents thought competition with out-of-state hunters while hunting big game in 1971 was either not noticeable or noticeable, but not objectionable. Thirty-three percent of the residents reported too much competition with non-residents and 28% had no opinion on the subject (Figure 21, Question 11). With regard to upland bird and waterfowl hunting, a large percentage of the residents had no opinion about competition with non-residents and less than one-third of those with an opinion thought there was too much competition.

The Salmon and Panhandle zones had the largest percentage of residents who reported too much competition with non-residents while hunting big game (Figure 22). In the Salmon River zone 47% of the residents reported too much competition with out-of-state hunters and only 10% thought the competition was not noticeable. Because of the small population in the Salmon River zone, a large percentage of the hunters in that zone are traditionally non-residents.

The type hunting residents preferred was related to their views of competition with out-of-state hunters. Thirty-seven percent of the residents who preferred big game hunting thought there was too much competition compared to 24% of those who preferred upland bird hunting and 12% of those who preferred waterfowl (Table 37).

The number of years residents had hunted

Table 34. — The percentage of resident hunters grouped by the type hunting they preferred and their satisfaction with hunting, who thought non-resident hunters should be limited to areas where residents not adequately harvest game or to a percentage of all hunters.

Table 36. The views of residents grouped by the competition they experienced with out-of-state big game hunters in Idaho during 1971 regarding the Fish and Game Commission policy on restriction of out-of-state hunters.

Group	Sample size	Opinions on commission policy (% of people)				
		Allow more	Allow fewer	Correct number	Did not know policy	No opinion
<b>Competition experience</b>						
Not noticeable	759	4.9	13.6	30.3	23.9	16.2
Not objectionable	983	2.4	38.6	34.3	17.8	6.9
Too much	1439	0.2	80.9	6.6	9.7	2.5
No opinion	1196	1.0	29.6	12.2	20.1	37.0

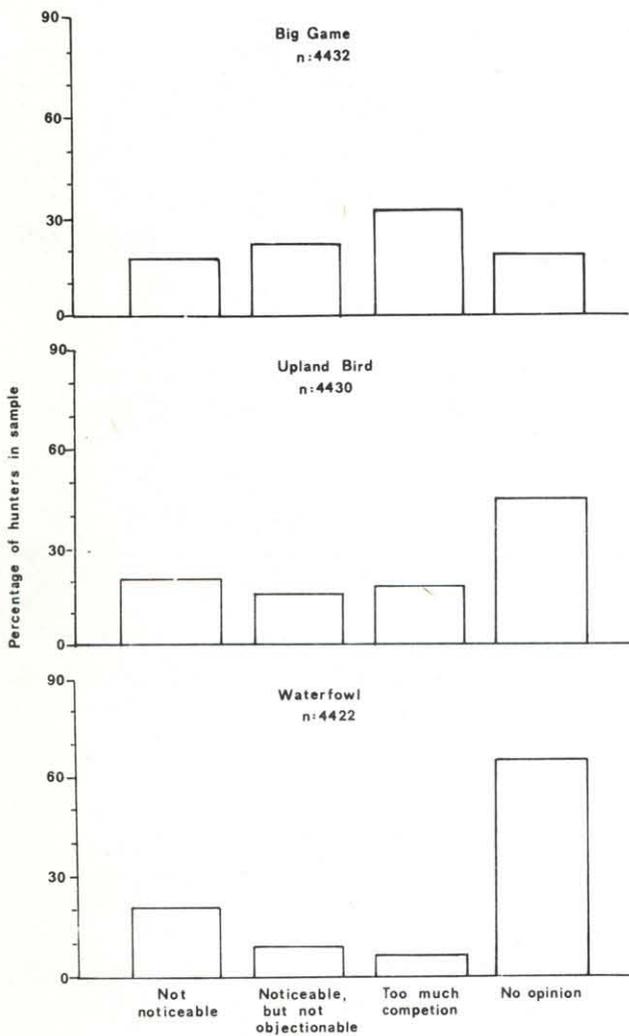

Figure 21. — The percentage of residents who thought competition with non-residents while hunting big game, upland birds or waterfowl in Idaho in 1971 was not noticeable, noticeable but not objectionable, too much, or had no opinion.

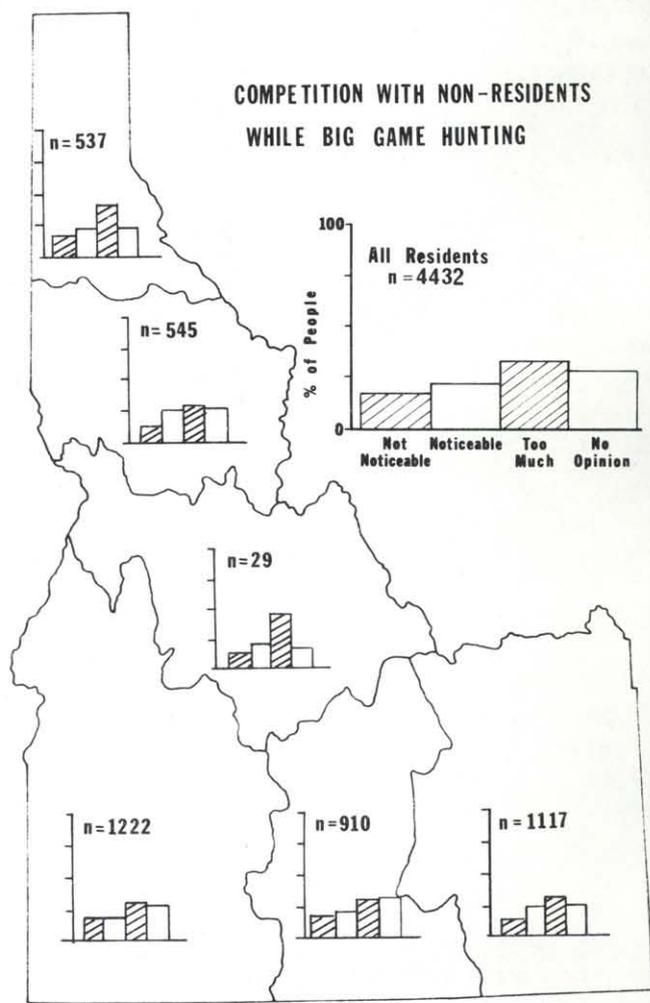

Figure 22. — The percentage of residents by zone of residence who thought competition with out-of-state hunters while hunting big game in 1971 was not noticeable, noticeable but not objectionable, too much, or had no opinion.

big game and upland birds in Idaho was a factor in their views of competition with out-of-state hunters. Residents who thought there was too much competition with out-of-state hunters when hunting big game or upland birds were most numerous among those who had only hunted one year (Table 37).

The group of people who ranked their hunting as unsatisfactory contained more people who reported too much competition with non-residents than the groups who ranked their hunting as satisfactory or excellent (Table 37). Fifty percent of the residents who reported they were not satisfied with their big game hunting thought there was too much competition with out-of-state hunters. Only 26% of those who ranked their hunting excellent thought there was too much competition.

Table 37. — The percentage of people grouped by years they hunted, type hunting they preferred, and their satisfaction with hunting who thought competition with out-of-state hunters was not noticeable, noticeable but not objectionable, too much, or had no opinion when hunting in Idaho during 1971.

### Hunting state-owned wildlife on federal land

— In the questionnaire sent to non-residents we substituted a question on hunting state-owned wildlife versus federal land for the one on competition with non-residents (Question 11). The question was worded as follows:

Idaho wildlife is owned by the state but much of the big game range is federal land.

Which of the following best expresses your views on out-of-staters and hunting of wildlife in Idaho? (Check one)

- \_\_\_ Residents should have preference in hunting for wildlife, with out-of-staters allowed to hunt only if residents cannot harvest the necessary game.
- \_\_\_ The number of out-of-staters should be limited to a fixed percentage of the total of resident hunters.
- \_\_\_ Out-of-staters should have equal opportunity with residents to hunt wildlife in states like Idaho with large areas of federal land.
- \_\_\_ No opinion.

A majority of the non-residents thought they should have equal opportunity with residents in hunting wildlife in a state like Idaho with large areas of federal land (Table 38). Twenty-eight percent of the non-residents thought Idaho should limit non-resident hunters in Idaho and six percent thought hunting should be limited only to residents. The slight difference in attitudes of people who purchased the bird license versus those with the combination or deer license may reflect the realization that most pheasant hunting takes place on private land.

**Proportion of out-of-state hunters** — In a special questionnaire (See Bjornn, 1975 A) to residents, we included information on the proportion of elk and deer hunters who were non-residents and asked the people to indicate if they thought the proportion was too high, about right, or too low. The question was worded as follows:

Listed below is the calculated percentage of elk and deer hunters in Idaho who were from out-of-state and their portion of the total harvest. Note that the relative abundance of out-of-state deer and elk hunters reached a peak in 1969 when 11.5% of the deer hunters and 16.7% of the elk hunters in Idaho that year were out-of-staters.

Out-of-staters have harvested 8-12% of the deer and 9-12% of the elk in recent years.

Table 38. The percentage of non-resident hunters who believed that residents should have preference in hunting for wildlife in Idaho, that the number of non-resident hunters should be limited, that non-residents should have equal opportunity with residents and those that had no opinion.

License	Number in sample	Non-resident hunting opportunity in Idaho (% of people)			
		Limit to residents	Limit non-residents	Equal opportunity	No opinion
Non-residents	1743	6.3	28.3	53.2	12.3
Combination	946	4.9	30.4	55.5	9.2
Bird	436	9.3	23.9	46.0	20.8
Deer	361	4.9	29.9	58.8	6.5

Year	Percentage of out-of-state hunters		Percentage harvest by out-of-state hunters	
	Deer	Elk	Deer	Elk
1966	8.0	12.5	7.9	20.9
1967	8.0	12.4	9.0	19.6
1968	9.7	15.1	10.6	21.3
1969	11.5	16.7	11.9	20.3
1970	10.4	14.7	10.9	19.0

Many of the out-of-state elk hunters use the services of outfitters and guides and are, therefore, somewhat more successful than resident elk hunters.

We estimate out-of-staters will comprise 8-10% of the deer hunters and 12-14% of the elk hunters who hunted in Idaho during 1971.

Which of the following best expresses your feelings regarding the proportion of elk and deer hunters in Idaho who are out-of-staters?

	Deer hunters	Elk hunters
Percentage out-of-staters too high	<input type="checkbox"/>	<input type="checkbox"/>
Percentage out-of-staters about right	<input type="checkbox"/>	<input type="checkbox"/>
Percentage out-of-staters too low	<input type="checkbox"/>	<input type="checkbox"/>
No opinions	<input type="checkbox"/>	<input type="checkbox"/>

Half the residents in the special survey

thought the proportions of out-of-state elk (12% in 1971) and deer (8.5% in 1971) hunters were too high, 30% thought the proportions were about right and less than 5% thought they were too low (Figure 23). The replies of residents to this question in the special questionnaire and to question 12 on commission policy in the regular questionnaire were reasonably consistent (Figure 23 and Table 35). Approximately half the residents in the regular survey thought the Commission should have restricted non-resident hunters to a smaller number and 19% thought the number was about right. Seventeen percent of the residents didn't know the Commission policy regarding out-of-state hunters in the regular questionnaire (Table 35). In the special questionnaire results, 30% of the people thought the proportion of non-resident hunters was about right indicating that many of the people in the regular survey who didn't know the policy thought the number was about right when they were given the information (Figure 23 and Bjornn, 1975 A).

#### Restriction of non-residents - increased fees

— Nearly three-fourths of the residents indicated they would pay more for hunting licenses and tags to make up lost revenue if Idaho significantly restricted the number of out-of-state hunters (Table 39). One-fourth of the people were willing to pay an additional five dollars for a license or tags. Residents who purchased the less expensive hunt only license were as willing to pay additional fees as were people who purchased the combination license

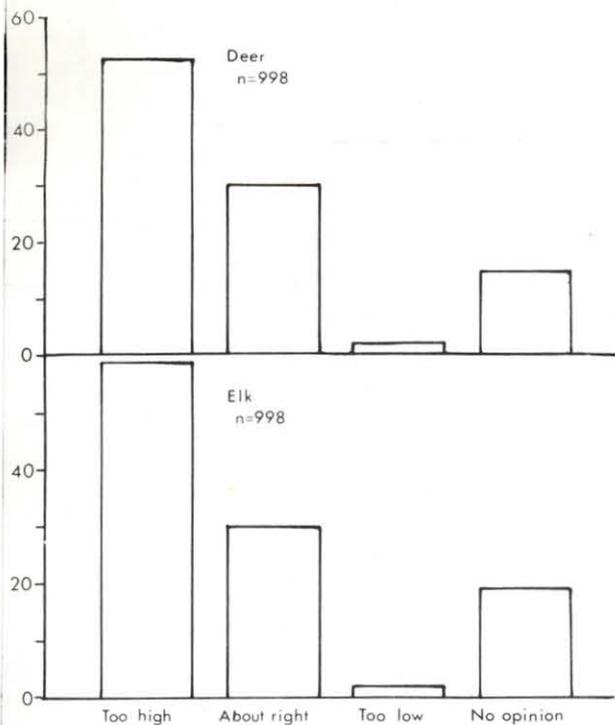

Figure 23. The percentage of residents who thought the proportion of out-of-state deer and elk hunters in Idaho was too high, about right, too low, or had no opinion.

Table 39. — The percentage of residents who purchased licenses in 1971 who were willing to pay more for licenses and tags to hunt in Idaho if the number of non-residents were significantly restricted.

License class	Number in sample	Percentage willing to pay more	Percentage of people willing to pay specified additional amount			
			\$1	\$3	\$5	More
Residents						
License	3895	69.3	21.7	20.3	17.6	9.8
Elk tag	3536	71.6	25.9	19.4	17.6	8.7
Deer tag	3600	70.9	32.6	19.4	11.6	7.3
Combination						
License	2586	69.0	20.1	20.2	18.3	10.3
Elk tag	2366	72.2	25.4	19.4	18.3	9.1
Deer tag	2396	71.1	32.6	18.7	12.1	7.6
Upland only						
License	1309	70.0	24.6	20.3	16.2	8.8
Elk tag	1170	70.6	26.9	19.2	16.4	8.0
Deer tag	1204	70.7	32.6	20.5	10.7	6.8

Fewer residents from the Salmon River residence zone were willing to pay increased fees than people in any other zone of the state (Figure 24). Only 54-55% of the people from the Salmon River zone were willing to pay more for licenses and tags compared to 69-73% from the other zones.

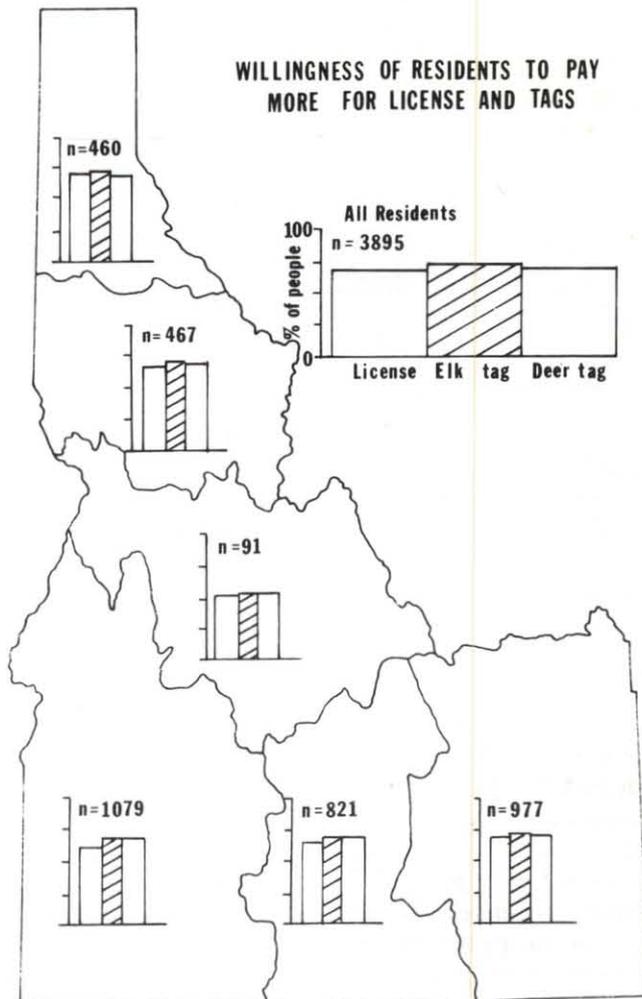

Figure 24. — The percentage of residents by zone who were willing to pay more for licenses or tags if the number of out-of-state hunters were restricted.

Most non-residents were not willing to pay increased fees to hunt in Idaho (Table 40). Seventeen percent of the non-residents who purchased the combination license (\$135) and 20% of those with the deer license (\$75) were willing to pay more to hunt big game. Twenty-five percent of the out-of-staters with the bird license (\$35) were willing to pay more for upland bird hunting.

The residents who reported "too much" competition with out-of-state hunters were more willing to pay increased fees for licenses or tags than those who reported that competition was not noticeable (Table 41). More than three-fourths of the group who reported too much competition would pay more compared to 57-59% of those who did not notice

competition with out-of-state hunters. The type hunting preferred had little influence on the willingness of residents to pay more for licenses and tags.

Table 40. — The percentage of non-residents who were willing to pay more for licenses to hunt big game, upland birds and waterfowl in Idaho in 1971.

### Management of Pheasants

**Noon opening** — The pheasant season in southern Idaho opens at noon and 48% of all residents in the survey favored the noon opening while 22% wanted the season to open at

daylight and 30% had no opinion (Figure 25). In northern Idaho, most residents did not have a strong preference for either a noon or early morning opening. In southern Idaho, however, most residents preferred the noon opening. Fifty percent of the non-residents with the bird license preferred the noon opening, 33% the early morning opening and 17% had no opinion. More of the hunters with many years of experience hunting upland birds preferred the noon opening than hunters with few years of experience (Table 42).

A majority of people in southern Idaho preferred the noon opening regardless of their occupation (Table 43). As expected, a large proportion of the farmers preferred the noon

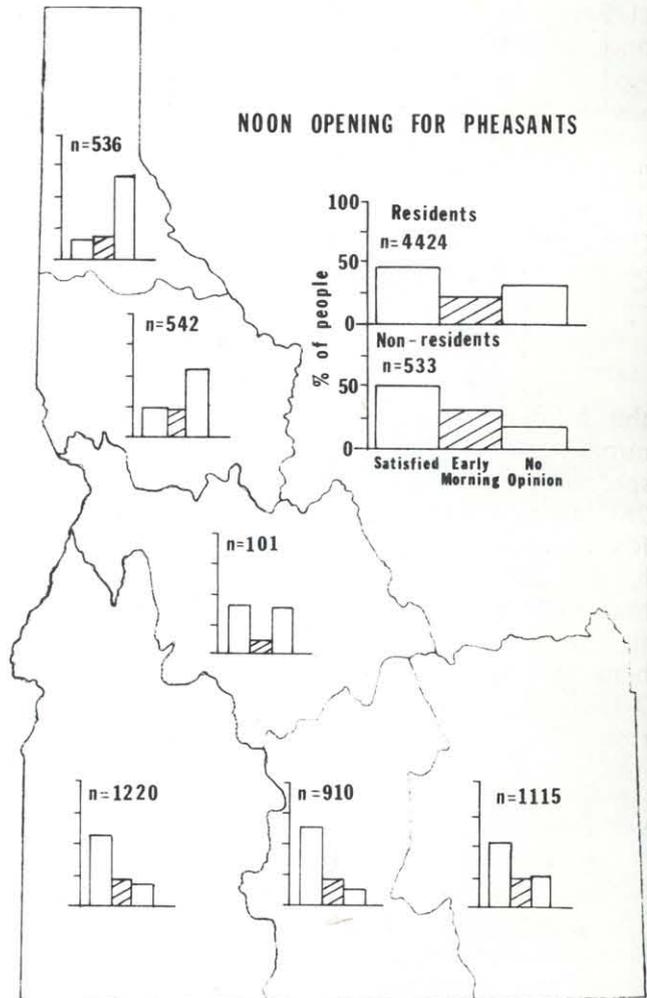

Figure 25. — The percentage of residents and non-resident bird hunters who preferred a noon or early morning opening for the pheasant season in southern Idaho.

opening but the proportion was not any larger than for many other occupational groups.

Table 42. — The percentage of residents grouped by years they had hunted upland birds who preferred the noon or early morning opening for pheasants in southern Idaho.

Years of upland bird hunting	Number in sample	Opening time (% of people)		
		Noon	Early morning	No preference
1	258	42.1	35.8	22.0
2-5	901	44.5	32.0	23.5
6-10	608	57.5	23.7	18.8
11+	1392	63.6	19.8	16.6

Table 43. — The percentage of residents (with combination license) of various occupation classes and residence zones who preferred the noon opening in southern Idaho.

Occupation class	Preferred the noon opening			
	Clearwater zone	Southwest zone	Southcentral zone	Southeast zone
Household	16.0	61.7	67.7	46.7
Small business	23.0	62.3	63.0	62.4
Craftsmen	19.2	66.3	68.8	64.7
Clerical and sales	16.7	67.1	78.1	65.2
Managerial	20.0	76.7	82.8	65.5
Professional and student	26.0	56.0	63.6	50.0
Farm	23.3	63.2	74.2	70.5
Retired	29.6	70.8	71.4	65.5

**Hunting of hen pheasants** — A majority of the hunters in the survey thought a limited number of hen pheasants should be taken under special regulations, seasons or bag limits (Figure 26). In the Panhandle, Clearwater and Salmon River zones, most residents favored a limited harvest of hen pheasants but a large proportion had no opinion on the subject. Only 16-22% of the residents from the various zones thought hens should not be hunted at any time and 7-13% thought hens should be hunted without restriction.

Most residents with an opinion, regardless of years of experience, type hunting preferred, or reason for hunting, thought limited hunting for hen pheasants should be allowed (Table 44). The group of people who ranked their upland bird hunting as unsatisfactory had a larger proportion of hunters who thought there should be no hunting for hens than those who had satisfaction or excellent hunting. The residents who hunted for a trophy also had a large proportion of people who thought hens should not be hunted.

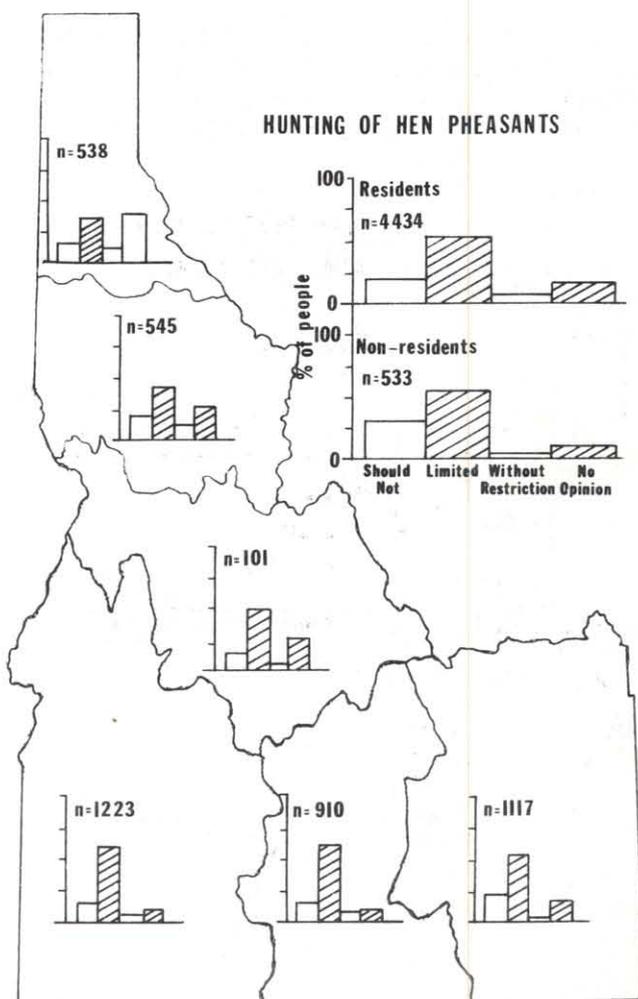

Figure 26. — The percentage of residents (statewide and from various zones) and non-residents who thought hen pheasants should not be hunted, thought limited numbers of hens should be harvested, thought hens should be hunted without restrictions, or had no opinion.

**Game Farm Pheasants** — Nearly half of the residents had no opinion on the question of providing hunting with pheasants produced in a game farm (Figure 27). Of those who expressed an opinion, about half thought providing hunting with game farm pheasants was a good program and should be continued and the other half thought it was a poor program and should be discontinued. In the Panhandle zone where the pheasant hunting is almost entirely dependent on pheasants produced in game farms, the people were evenly split on the question as they were in southern Idaho where game farm birds contribute little to the total harvest.

Nearly half of the non-residents with the bird license thought the Department should continue to provide hunting by releasing pheasants reared on game farms (Figure 27).

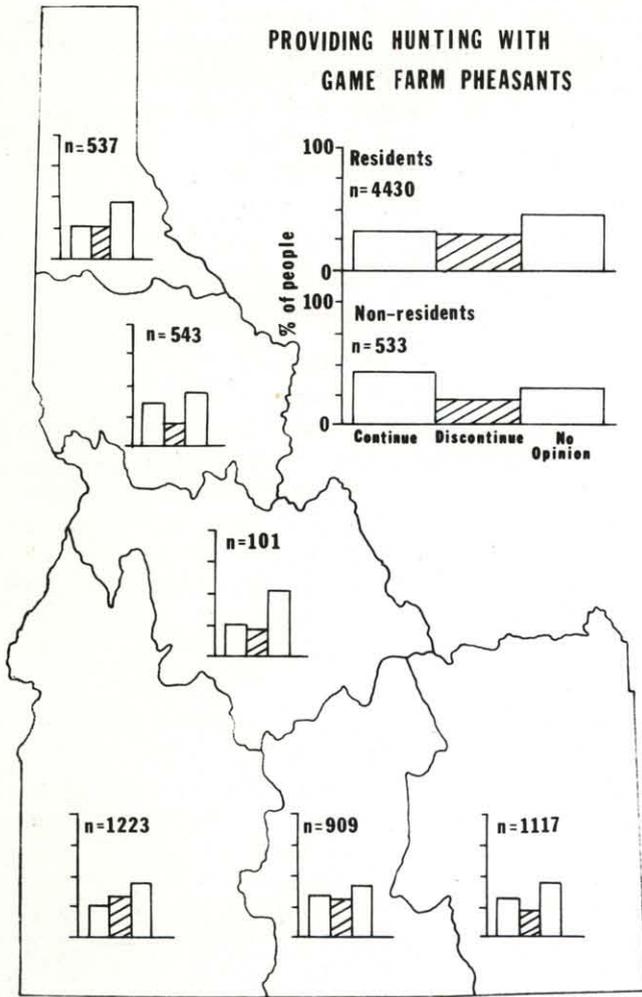

Figure 27. — The proportion of residents and non-resident bird hunters who thought providing hunting with game farm produced pheasants should be continued or discontinued.

Approximately one-third of the residents regardless of years of experience, satisfaction with upland bird hunting or reason for hunting thought hunting provided by game farm pheasants was a good program and should be continued (Table 45). A smaller proportion of the residents who preferred to hunt big game or hunted mainly for a trophy thought hunting for game farm pheasants was a good program compared to those who preferred to hunt birds or hunted for other reasons.

Table 44. — The percentage of resident hunters who thought hen pheasants should or should not be hunted in Idaho grouped by years of hunting, type hunting preferred, satisfaction with upland bird hunting and reason for hunting.

## Management of Big Game Herds

**Current policies of department** — A majority of the people in the survey who had an opinion approved the current policy of the Department with regard to regulating big game numbers (Figure 28, Question 22). In the Salmon River zone 50% of the residents disapproved of the Department's policy and in the Clearwater zone the proportion of people who disapproved equaled the proportion who approved.

Nearly one-third of the residents throughout the state did not know the Department's policy on regulating big game numbers (Figure 28). We

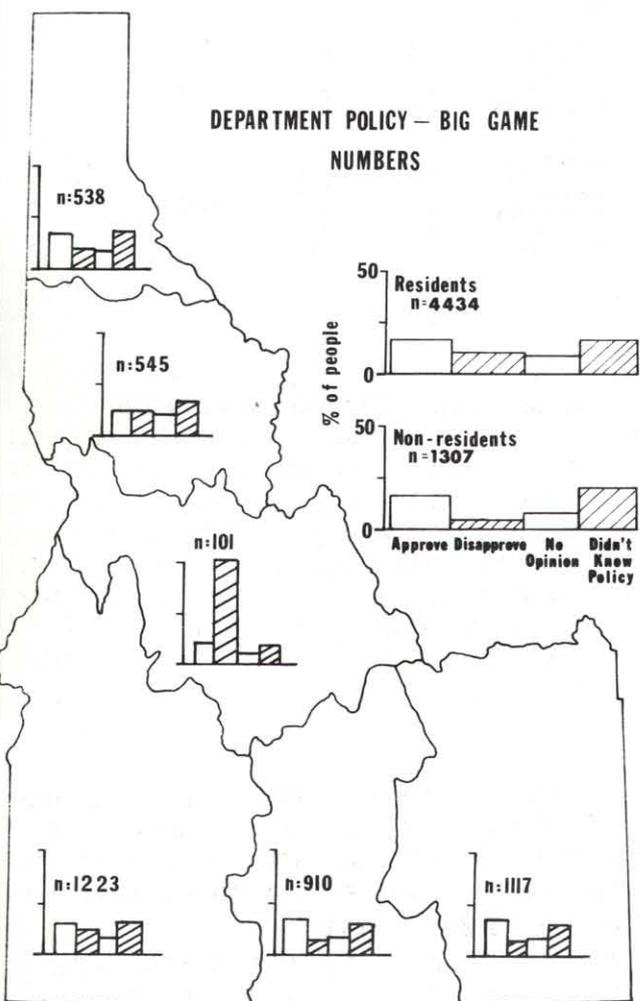

Figure 28. — The percentage of residents and non-residents who approved, disapproved, had no opinion, or did not know the Fish and Game Department's policy on regulating big game numbers.

did not inform the people in this survey of the Department's policy but we did in a special survey as listed below (Bjornn, 1975).

“The current policy of the Idaho Fish and Game Department is to attempt to regulate the abundance of big game animals in each area at the number which the natural winter range will support during normal winters. During emergency situations and severe winters, the animals will be herded, baited, or live trapped and moved to areas with natural feed if possible. Emergency winter feeding will be undertaken only as a last resort.”

With regard to the Department's policy on emergency winter feeding of big game, a majority of the people who knew the policy or had an opinion approved the policy (Figure 29, Question 22). Nearly one-third of the residents did not know the policy on winter feeding as briefly stated in the preceding paragraph. The Salmon and Clearwater River zones had the largest proportion of residents who disapproved of the policy on winter feeding.

### Supplemental feeding to increase herds —

About half the people in the survey thought the Department should attempt to increase big game herds through supplemental winter feeding (Table 46, first part of Question 22). Nearly one-third thought the Department should not attempt to increase big game herds in excess of the natural capacity of the winter range and 17% had no opinion on the question.

The opinions of people regarding supplemental winter feeding to increase big game herds varied, some based on the number of years they had hunted big game, their

Table 46. — The percentage of licensed hunters who thought the Department should or should not attempt to artificially increase the abundance of deer and elk through supplemental winter feeding.

Residence and license	Number in sample	Supplemental winter feeding (% of people)		
		Should not	Should	No opinion
Residents	4433	32.4	50.5	17.1
Combination	2963	34.5	48.7	16.7
Hunt only	1470	28.7	53.5	17.8

Combination	947	29.7	54.6	15.8
Deer only	361	27.6	58.3	14.2

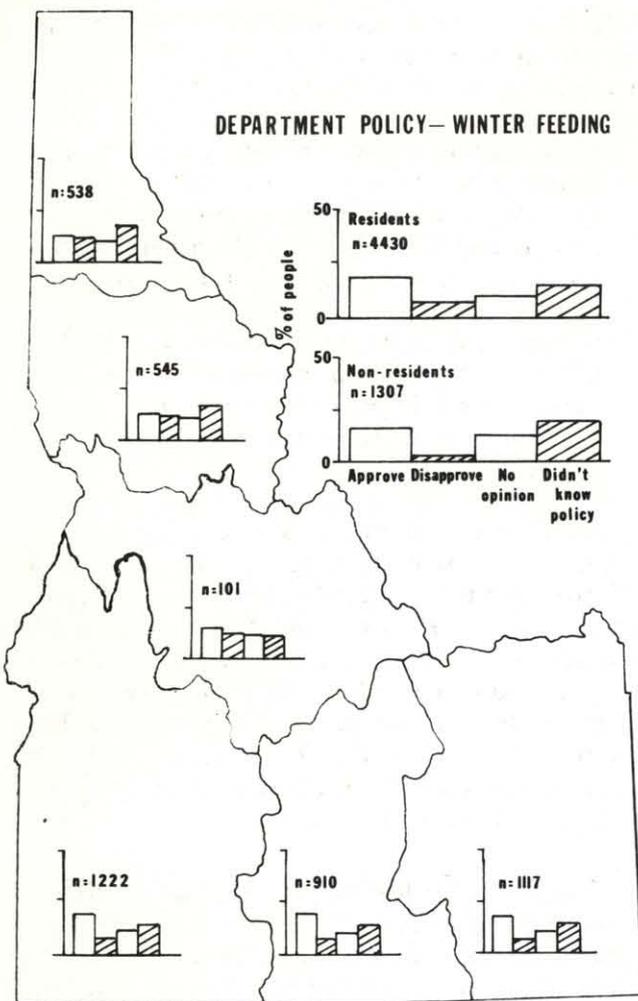

Figure 29. — The percentage of residents and non-residents who approved, disapproved, had no opinion, or did not know the Fish and Game Department's policy on winter emergency feeding of big game.

satisfaction with hunting, their primary reason for hunting and occupation (Table 47, Question 22). The groups of residents who reported few years of hunting experience, unsatisfactory big game hunting and hunting primarily for meat or trophy had the largest proportions of people who thought the Department should increase big game herds through supplemental winter feeding. Groups with many years of hunting experience, excellent hunting, who hunted mainly for companionship or isolation and were farmers, managers, retired or professionals had the smallest proportion of people who thought the Department should increase big game herds through supplemental winter feeding.

Table 47. — The percentage of resident hunters who thought the Idaho Fish and Game Department should or should not attempt to increase big game herds by supplemental winter feeding, grouped by years they hunted big game, satisfaction with their big game hunting, their main reason for hunting, and their occupation.

**Winter range - basis for management** — A majority of the residents and non-residents thought the amount and condition of vegetation on big game winter range was the proper basis for managing big game populations (Table 48, Question 18). Seventeen percent of the residents did not think winter range vegetation was the proper basis for management of big game herds and 26% did not have an opinion on the question.

Table 48. — The percentage of residents and non-residents who believe the amount and condition of vegetation on big game winter range was or was not the proper basis for managing big game populations.

License class	Number in sample	Winter range-basis for management (% of people)		
		Yes	No	No opinion
Residents	4428	57.1	17.1	25.8
Combination	2960	58.9	16.2	25.0
Hunt only	1468	54.1	18.6	27.3

**Supplemental salt for big game animals** — A large proportion of the residents (61%) thought it was necessary to distribute supplemental salt for big game animals and that the program should be continued or expanded (Table 50, Question 14). Only 5% of the residents thought the distribution of supplemental salt for big game animals was unnecessary and 34% did not have an opinion on the question. A larger proportion (44%) of the non-residents had no opinion on the question, but 50% thought the distribution of salt for big game was necessary.

Two-thirds of the hunters who had hunted 6 or more years for big game thought it was necessary to distribute supplemental salt for big game, while only 56% of the hunters who had hunted only 1 year thought it was necessary (Table 51, Question 14). A smaller proportion of the residents who were retired or had managerial or professional occupations thought supplemental salt for big game was necessary compared to the people in the rest of the occupation groups.

Table 50. — The percentage of licensed hunters who believed there should be supplemental salting of big game, those who believed supplemental salting unnecessary, and those having no opinion.

**Quantity versus quality hunting** — Ten percent of the residents wanted the big game herds managed for quantity hunting which we described in the questionnaire as maximum harvest — open season with no restrictions on the number of hunters and a lower success rate (Table 52, Question 15). Twenty-one percent of the residents preferred the department to manage each herd for quality hunting which we described as trophy animals, less than maximum harvest of animals, low density of hunters through use of special permits and a higher rate of success. The largest proportion of hunters (41%) wanted some herds managed for quality hunting and some for quantity hunting.

The non-residents who hunted for big game were about evenly divided on preferring the herds managed for quality hunting or managed

for both quality and quantity hunting (Table 53, Question 15). Only 6% of the non-residents preferred management for quantity hunting.

Table 52. — The percentage of residents and non-residents who preferred to manage big game herds for quantity, quality, or both types of hunting.

**Methods of restricting or increasing harvest**

— A shorter general season was the preferred method of restricting the harvest of big game in most areas of the state except for south central and southeastern Idaho (Figure 30, Question 16). In south central Idaho most residents

preferred to restrict the big game harvest through controlled hunts in which the number of hunters would be regulated by a drawing and thus regulating the number of animals harvested but a longer season would be allowed. In Southeastern Idaho the residents were evenly split between the two methods of restricting the harvest. Only 12% of the residents had no opinion on the question.

The preferred method of restricting the harvest varied with the age, years of hunting big game, satisfaction with big game hunting, and the primary reason for hunting (Table 54, Question 16). The proportion of residents who preferred to restrict the harvest by reducing the

Other	37	38.3	45.6	16.1

length of the hunting season increased from the youngest age groups up through the oldest age groups and from the people who had few years of hunting experience up to those who had many years of hunting experience. A larger proportion of the residents who reported unsatisfactory big game hunting preferred to restrict the harvest by a reduced season than those who had excellent or satisfactory experience hunting for big game. The people who had excellent or satisfactory hunting for big game were evenly split in preferring either a reduced season or a controlled hunt to restrict the harvest of big game. Fifty percent of the people who hunted primarily for a trophy preferred to restrict the harvest by means of a controlled hunt and only 39% preferred the reduced season length.

When an increased harvest of deer is necessary in a particular management unit 47% of the residents preferred to increase the length

of the season and allow 1 deer per hunter on the regular tag (Figure 31, Question 17). Forty-two of the residents preferred to provide extra deer tags so that hunters may take an additional deer when an increased harvest is necessary. Southeast Idaho was the only zone in the state where a majority of the people preferred to increase the harvest through the use of extra deer tags. Most non-residents (58%) also preferred to use extra deer tags to increase the harvest of deer. Thirty-three percent of the non-residents preferred to increase the season length.

The proportion of hunters who preferred either method of increasing the harvest of deer did not differ based on the years of big game

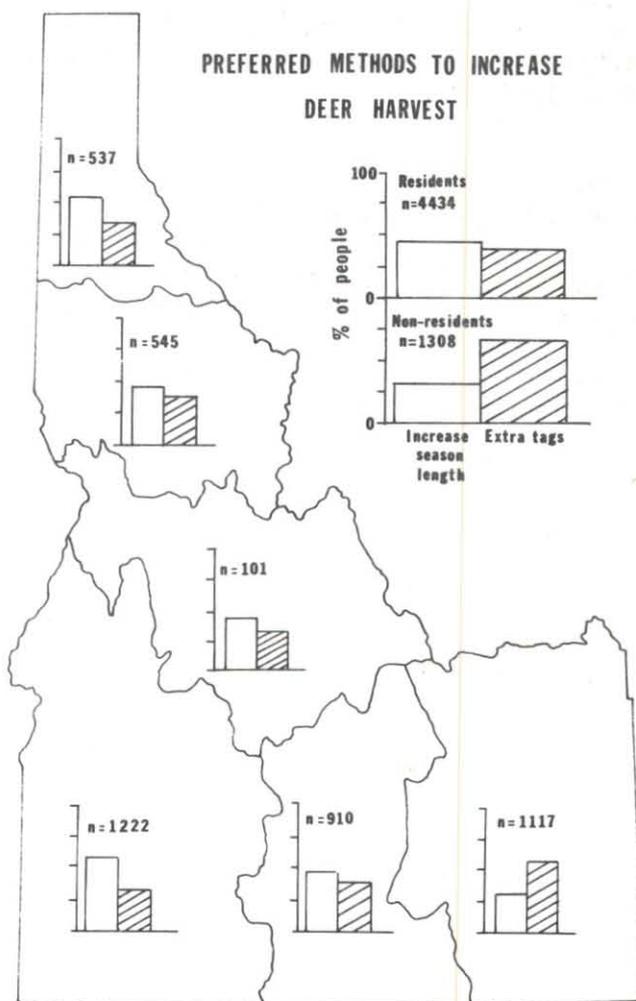

Figure 31. — The percentage of residents and non-residents who preferred to increase the deer harvest by increasing the length of the season or providing extra tags.

hunting (Table 55, Question 17). Fifty-six percent of the residents who ranked their big game hunting in 1971 as unsatisfactory preferred to increase the harvest by increasing the length of the season while only 38% preferred to issue extra tags. A majority of the hunters who ranked their hunting as excellent in 1971 preferred to provide extra tags to increase the harvest. Hunters who had unsatisfactory hunting wanted additional time to bag an animal and those who reported excellent hunting wanted the opportunity to bag additional deer. Except for the residents who hunted primarily for meat, a majority of the people who hunted for other reasons preferred to increase the season length to increase the harvest of deer. Forty-eight percent of the residents who hunted primarily for meat preferred to increase the harvest of deer by providing extra tags, a preference which was consistent with their reason for hunting.

Table 55. — The percentage of resident hunters who preferred to increase the length of the season or allow extra tags to increase the harvest of deer when necessary with response by years of hunting, satisfaction with big game hunting and reason for hunting.

**Roads-big game huntings** — Most residents (75%) and non-residents (73%) thought no more roads were needed for big game hunting in Idaho. (Figure 32, Question 23). Forty-eight percent of the residents thought overcrowding

of big game hunting areas had already occurred because of too many roads and that no new roads should be constructed and some of the existing roads should be closed. Only 10% of the residents thought more roads should be constructed in big game areas to provide improved access and easier hunting. Twenty-seven percent of the residents thought present access to big game areas by roads was adequate and no more roads were needed. The belief that no more roads were needed in big game areas was uniform throughout all the zones of the state. A large proportion of the residents thought no more roads were needed or there were already too many roads regardless of

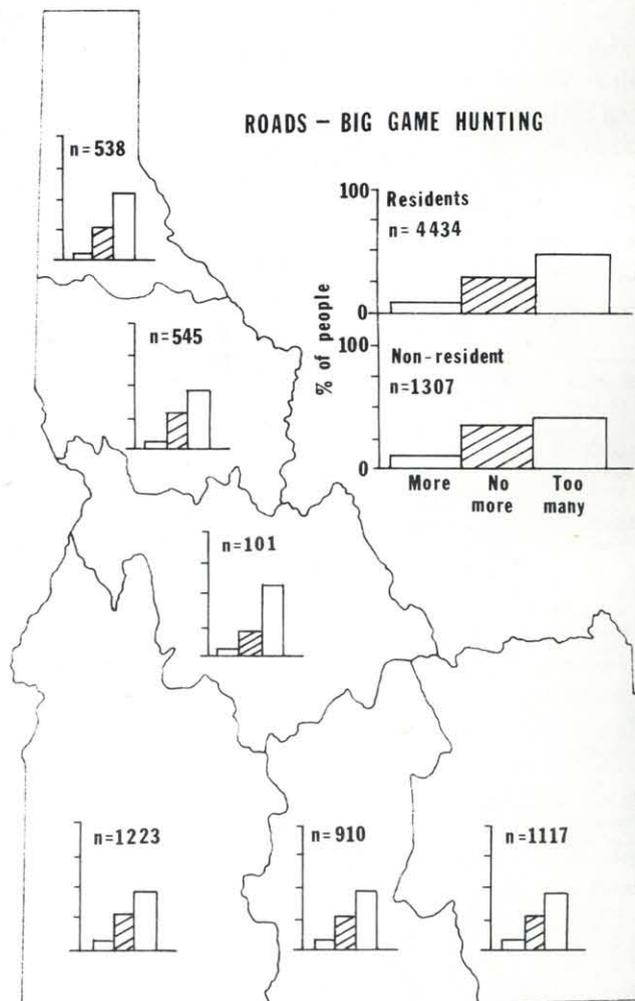

Figure 32. — The percentage of residents and non-residents who thought more roads were needed, no more were needed, or there were already too many roads with regard to big game hunting in Idaho.

their age, occupation, years of hunting, preferred type of hunting, satisfaction with hunting, or reason for hunting (Table 56, question 23). The proportion of residents who thought too many roads were present in big game areas decreased with increasing age group. More than 70% of the residents, regardless of age group, thought no more roads were needed or there were too many. Fifty-two percent of the residents who had hunted 11 or more years thought there were too many roads versus forty-one percent of the hunters who had hunted only one year. Of the residents who hunted primarily for trophy or for the isolation, 55 and 67% respectively thought there were too many roads in big game hunting areas. Only 4%

of the residents who hunted primarily for the isolation thought there should be more roads in big game areas.

### Bear Hunting

A majority of the residents and non-residents had no opinion on the time of year to hunt bears (Figure 33). In the Panhandle zone, where more people hunt bears, 40% preferred to hunt in the fall, 35% had no opinion and 13% wanted to hunt all year. In the Clearwater and Salmon River zones, 25-27% wanted to hunt in the fall, 18-21% wanted to hunt all year and 37-43% had no opinion.

Table 56. — The percentage of resident hunters who believed there should be more roads, no more roads were needed, there were too many roads or had no opinion on the question of roads as related to big game hunting by age group, occupation, years of hunting, hunting preference, satisfaction with hunting, and reason for hunting.

11+	1745	32.6	2.5	5.1	14.5	45.3

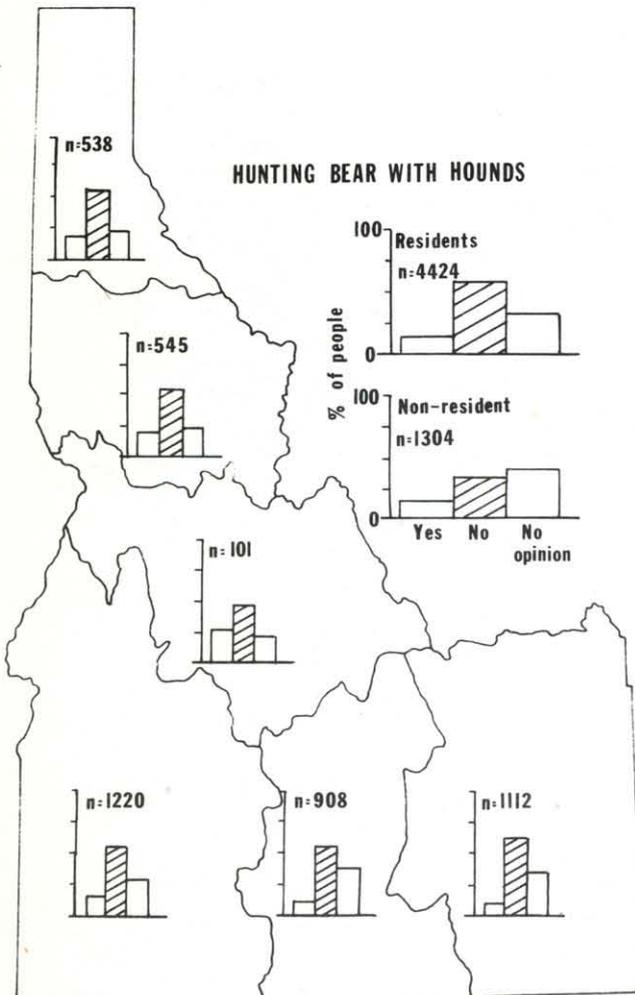

Figure 34. — The percentage of people who thought bears should or should not be hunted with hounds in Idaho.

A majority of residents thought bears should not be hunted with hounds (Figure 34). The Salmon River zone had the largest percentage of people who wanted to hunt bears with hounds and the south Idaho zones had the least.

The same proportion of residents thought bears should not be hunted with hounds regardless of the number of years of big game hunting experience (Table 58). Most hunters who thought bears should be hunted with hounds wanted to hunt in the fall, especially those with many years of experience.

### Programs of Fish and Game Department

Law enforcement, habitat improvement and emergency winter feeding were the activities of the Fish and Game Department ranked most important by 60% of the residents in the survey (Table 59). Twenty-three percent of the residents thought law enforcement was the most important activity, 19% ranked habitat and winter feeding as most important, 10% listed management programs and acquisition of wildlife areas as top priority and 8% thought predator control was the most important activity.

The percentage of residents who ranked the various activities as most important differed between zones of the state (Figure 35). In the Salmon River zone, 23% of the residents ranked predator control as the most important activity of the Department compared to only 7% of the people in the southern Idaho zones. Law enforcement, habitat improvement and emergency winter feeding were listed as the most important activities by the largest proportion of the people in all zones of the state.

Twenty-four percent of the non-resident who purchased the big game hunting licenses listed emergency winter feeding as the most important activity, 18% selected habitat improvement, 13% law enforcement, 11% management programs and acquisition of wildlife areas, 8% research and evaluation and 6% for each predator control and improve access (Table 59). Non-resident bird hunters differed from residents and non-resident big game hunters in their opinions of which activities were most important. The largest group of non-resident bird hunters (21%) ranked

le 58. — The percentage of resident hunters who thought bear should or should not be hunted with hounds, and if they should, when they should be hunted, grouped by years of hunting big game.

Years of hunting big game	Hunt with hounds			When hunt with hounds					
	Number in sample	Yes	No	No opinion	Number in sample	Fall	Spring	Fall and spring	All year
1	325	13.0	55.5	31.5	50	45.2	12.3	17.8	24.6
2-5	1031	14.7	58.1	27.3	188	41.3	16.2	17.3	25.2

Acquisition of wildlife areas	9.6	10.7	19.5
Improved access	4.3	5.5	9.7
Public information programs	3.0	2.2	4.0
Research and evaluation	3.2	7.5	6.7

Residents who preferred big game hunting did not differ in opinions regarding the most important activities of the Department from upland bird hunters except in the activities of acquisition of wildlife areas and emergency winter feeding (Table 60). A larger proportion of the people who preferred big game hunting ranked winter feeding as the most important activity than those who preferred upland bird or waterfowl hunting. More of the people who preferred waterfowl hunting than those who preferred to hunt big game thought acquisition of wildlife areas was the most important activity.

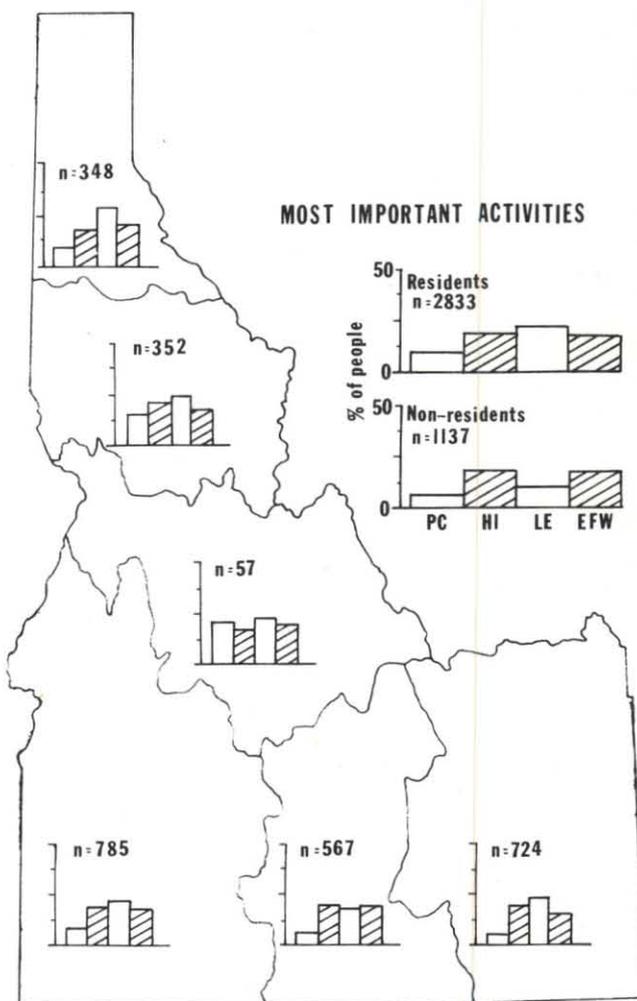

Figure 35. — The percentage of residents and non-residents who thought predator control (PC), habitat improvement (HI), law enforcement (LE), or emergency winter feeding (EFW) were the most important activities of the Idaho Fish and Game Department.

Table 60. — The percentage of resident hunters who ranked each of the activities listed below as the most important activity for the Fish and Game Department by years of hunting, hunting preference, and age.

Group	Number in sample	Fish and Game Department Activities (% of people)									
		Predator control	Habitat improvement	Law enforcement	Management programs	Game farms	Emergency winter feeding	Acquisition wildlife areas	Improved access	Public information	Research and evaluation

The opinions of residents of various age groups regarding most important activities differed little except on winter feeding and perhaps habitat improvement (Table 60). Fewer people in the older age groups ranked emergency winter feeding as the most important activity than in the younger age groups.

A majority of the people thought the Department should place more emphasis on all the activities listed except predator control, game farms and improved access to hunting areas (Table 61). Those three activities were the only ones a sizeable number of people (26-37%) indicated the department should deemphasize.

Table 61. — The percentage of residents and non-residents who believed the Fish and Game Department should place more, less, or no change in the emphasis on various activities.

Activity and residence	Number in sample	Emphasis on activity (% of people)		
		More	Less	No change
Predator control				
Residents	3195	27.6	26.0	46.5
Non-residents	981	23.9	23.1	53.0
Habitat improvement				
Residents	3251	74.8	2.1	23.1

Research and evaluation programs				
Residents	3063	55.7	8.2	36.1
Non-residents	979	67.0	3.0	30.0

Residents of different age, years of hunting experience and occupations differed in their opinions regarding the emphasis they thought the Department should place on predator control (Table 62). More of the older people and those with many years of hunting experience favored more emphasis on predator control compared to the younger or less experienced people. The retired and farm

occupation groups had the largest proportion of people who wanted more emphasis on predator control. The professional group had the smallest proportion of people who favored more predator control.

Table 62. — The percentage of resident hunters who believed the Fish and Game Department should place more, less, or no change in the emphasis on predator control grouped by age, years hunted, and occupation classes.

Group	Number in sample	Emphasis (% of people)		
		More	Less	No change
<u>Age groups</u>				
Less than 20	625	25.9	23.1	51.0

## DISCUSSION

The responses of the resident and non-resident hunters in this survey to questions on wildlife management issues were based on their knowledge and experiences. We did not provide information on the tradeoffs associated with each alternative choice of response to the questions. The responses of resident hunters differed on many questions from the responses of Department of Fish and Game employees, who also completed the same questionnaire

(Bjornn, 1975B). Some of the differences in opinions and preferences between resident hunters and Department employees was due to a difference in knowledge of Department policies or biological constraints, but the remainder of the difference resulted from differences in value systems between the two groups.

In a special survey (Bjornn, 1975A), we provided supplemental information with many of the issues in a questionnaire sent to another sample of resident hunters. The response of residents to questions involving a knowledge of Department policies or of the biological consequences of each choice tended to be more like that of Department employees when we supplied the residents with additional information. The supplemental information we provided in the special survey questionnaire had little effect on the response of residents to questions with choices based on social or economic judgments.

Most Idaho residents hunted mainly for meat while many non-residents hunted for a trophy. In British Columbia, Bowden and Pearse (1968) found just the opposite; residents tended to hunt for a trophy and non-residents consisted mostly of meat hunters. In a survey of hunters who used the Sawtooth area in central Idaho, Michalson (1973) reported that meat was the most important reason for hunting for 24% of the respondents. In our survey, 43% of the residents on a statewide basis and 12% of the non-residents hunted primarily for meat. In a Nevada survey, Garrett (1970) reported that half the residents thought there were too few deer,

but the number of hunters did not upset them. In Idaho, lack of game was the primary reason for dissatisfaction of 40% of the resident big game hunters and 28% complained of too many hunters.
